The Global Economy

Government Debt & Deficits

The idea

- Governments issue debt when spending exceeds revenue. When they issue too much debt, investors bail out, possibly triggering a crisis.
- Open question: how much is “too much”?

Roadmap

- Macroeconomic crises
- Words and pictures
- Debt arithmetic
- Debt dynamics
- What’s missing?
- Is the US in trouble?

Macroeconomic crises

- New module
- The classic crisis triggers
  - Sovereign debt ("debt crisis")
  - Financial fragility ("financial crisis")
  - Fixed exchange rates ("exchange rate crisis")
- What was/is the trigger in
  - The US in 2008?
  - Mexico in 1994?
  - Europe today? (Greece, Ireland, Spain, …)
**Words**

  - Every system of Public Credit must assume as a fundamental principle the ability to pay the debt which it contracts. With the creation of debt should be incorporated the means of extinguishment.
- What is he saying? Do you agree?

**Words**

- Angela Merkel, *Financial Times*, March 2009
  - The German chancellor warns world leaders against pumping too much money into reviving global growth, saying such action would create and “unsustainable” recovery. She rejected calls to spend more public money in Germany as part of a coordinated stimulus program.
- What is she saying? Do you agree?

**Government deficits (2011, % of GDP)**

**Debt arithmetic**

**Government budget: Principle #1**

- Principle #1 of fiscal policy
  - Government spending must be financed with tax revenue, either now or in the future
Government budget: ingredients

- Government spending in year $t$
  \[ G_t + V_t + iB_{t-1} \]
  - $G$ = government purchases of goods and services
  - $V$ = government spending on transfers
  - $i$ = interest rate on debt $B$
- Government tax revenue in year $t$
  \[ T_t \]
- Government debt at end of year $t-1$, start of year $t$
  \[ B_{t-1} \]

Government budget

- Budget (cash flow out = cash flow in)
  \[ G_t + V_t + iB_{t-1} = T_t + B_t - B_{t-1} \]
  Spending = Tax Revenue + Change in Debt
- Government deficit
  \[ (G_t + V_t + iB_{t-1}) = T_t \]
- Primary deficit (excl interest)
  \[ D_t = (G_t + V_t) - T_t \]
  (replace three symbols with one)

Government budget: US, 2011, $b$

<table>
<thead>
<tr>

</tr>
<tr>
<td>Surplus</td>
<td>-1,249</td>
</tr>
</tbody>
</table>

For reference: GDP = 15,094

Source: BBA, Table 3.1, aggregated

Government budget arithmetic

- Primary deficit (excl interest)
  \[ D_t = (G_t + V_t) - T_t \]
- Budget becomes
  \[ G_t + V_t + iB_{t-1} = T_t + B_t - B_{t-1} \]
  \[ D_t + iB_{t-1} = B_t - B_{t-1} \]
- The point: this is how debt is connected to deficits
  - Past debt incurs interest expense
  - Current deficits lead to increases in debt

Government budget arithmetic

- Looking back in time
- Where does debt come from?
  \[ D_t + iB_{t-1} = B_t - B_{t-1} \]
  \[ B_t = D_t + (1+i)B_{t-1} \]
  \[ = D_t + (1+i)D_{t-1} + B_{t-2} \]
- Answer: debt = past primary deficits plus interest
Government budget arithmetic

- Looking forward in time
- Where does debt lead? [kill time for simplicity]
  \[ D_t + iB_{t-1} = B_t - B_{t-1} \]
  \[ \Rightarrow B_{t-1} = - \frac{D_t}{(1+i)} + \frac{B_t}{(1+i)} \]
  \[ = - \frac{D_t}{(1+i)} - \frac{D_{t+1}}{(1+i)^2} + \frac{B_{t+2}}{(1+i)^2} \]
- Answer: debt = present value of future primary surpluses
  - Debt today is a promise to run surpluses in the future

Government budget: Principle #1

- Principle #1 of fiscal policy
  - Government spending must be financed with tax revenue, either now or in the future
  - That’s what the arithmetic says

Debt dynamics

- What makes ratio of debt B to GDP Y change over time?
- Both numerator and denominator can change
- Two ways to reduce B/Y
  - Decrease debt
  - Increase output
- Here’s how that works …

Debt dynamics

- We usually look at debt and deficits as ratios to GDP
- How do they change over time?
- Growth of (nominal) debt
  \[ B_t = (1+i) B_{t-1} + D_t \]
  \[ = (1+r+\pi) B_{t-1} + D_t \]
  \[ \Rightarrow B_t = (1+r+\pi) B_{t-1} + D_t \]
- Growth of (nominal) GDP
  \[ Y_t = (1+g+\pi) Y_{t-1} \]
  \[ = (1+g+\pi) Y_{t-1} \]
- Both numerator and denominator of B/Y change

Debt dynamics

- Reminder:
  \[ 1 \quad B_t = (1+r+\pi) B_{t-1} + D_t \]
  \[ 2 \quad Y_t = (1+g+\pi) Y_{t-1} \]
- Summary
  \[ \frac{B_t}{Y_t} = (1+g+\pi) \frac{B_{t-1}}{Y_{t-1}} + \frac{D_t}{Y_t} \]
  \[ = (1+g) \frac{B_{t-1}}{Y_{t-1}} + \frac{D_t}{Y_t} \]
  \[ = \frac{B_{t-1}}{Y_{t-1}} + g \frac{B_{t-1}}{Y_{t-1}} + \frac{D_t}{Y_t} \]
  \[ \Delta(B_t/Y_t) = r \frac{B_{t-1}}{Y_{t-1}} - g \frac{B_{t-1}}{Y_{t-1}} + \frac{D_t}{Y_t} \]
Debt dynamics

- Ok, what are we left with?
  \[ \Delta(B_t/Y_t) = r\frac{B_{t-1}/Y_{t-1}}{B_t/Y_t} - g\frac{B_{t-1}/Y_{t-1}}{B_t/Y_t} + D_t/Y_t \]

  - (A): interest on debt
  - (B): growth in the economy
  - (C): (primary) deficit

Source: Hall and Sargent
What’s missing?

- The impact of growth on tax revenue
- GDP growth
  - Affects B/Y directly
  - Also raises tax revenue, reduces primary deficit
  - The best cure for debt problems (and reverse)
- Examples?

What’s missing?

- The impact of debt in the interest rate
- Interest rate can rise sharply if investors become concerned with repayment
  - Direct impact on changes in debt through $r = i - \pi$
- When does it happen?
- Examples?

What’s missing?

- Hidden liabilities
- Like what?
  - Unfunded pensions
  - Financial bailouts
  - Implicit guarantees of business or regional governments
- Examples?

What’s missing?

- Maturity of debt
- Short debt needs to be rolled over
  - Interest rate could rise quickly
  - Or you could be shut out of markets altogether
- Examples?

Is the US in trouble?
Is the US in trouble

- Large current deficits
- Growing debt
- Significant increases in future spending in the pipeline
- Blinder and Hubbard, Wash Post, Sept 19, 2011
  - The (total) deficit is forecast by the CBO to reach 15.5% of GDP by 2035. By then, the national debt would be 187% of GDP. The main culprit is increased health care spending, which CBO projects to rise from 5.6% of GDP now to 10.4% by 2035.

US government expenses & revenues

US government debt

Source: CBO.

US government debt

Source: CBO.

US government debt

Source: CBO.

Demographics

Source: Congressional Budget Office.
Social Security outlays and receipts

- Solutions
  - Increase the payroll tax – or other taxes
  - Reduce benefits
  - Raise retirement age
  - Reduce cost-of-living adjustments
- Congressional Budget Office analysis (2010)

Medicare and Medicaid

- Medicare: age 65 and older
  - Parts A&B cover hospital and physician care
  - Part D (2006) covers drugs
  - Funded by payroll tax and general revenues
- Medicaid: poor (joint state-federal program)
  - Federal government share about 57%
  - States set rules subject to federal approval

Medicare and Medicaid

- Healthcare spending per insured rising faster than GDP
- Ageing population

Medicare and Medicaid

- All other medical spending

Medicare and Medicaid “fixes”

- Health care system as a whole is a mess
- What can be done for Medicare and Medicaid?
  - Spending needs to be paid for
  - Either raise taxes: by a lot!
  - Or reduce benefits: but how?
- The central budget issue of our time

What have we learned?

- Government budgets: deficits are financed by
  - By issuing debt today
  - And running (primary) surpluses in the future
- Signs of trouble
  - Too much debt
  - Continuing deficits
  - Weak political system
- US faces questions about future healthcare spending

The Global Economy

*Foreign Exchange*

The ideas

- Exchange rates are …
  - Relative prices of currencies (dollar price of one euro)
  - Source of variation in costs, revenues, etc
  - Where sensible theories come to die

Roadmap

- Announcement and reminder
- In the news
- Heineken USA
- Words and pictures
- Exchange rates and prices (“PPP anchor”)
- Exchange rates and interest rates (“carry trade”)

Announcement

- Special class meetings at Amity Hall
  - Saturday class: April 28, after class
  - Monday class: May 7, after the exam
  - Amity Hall, 80 West 3rd Street, probably downstairs
Reminder

• Problem Set #4 due next class
  – Email questions
  – We’ll post answers to all on the announcements page

In the news

• “Yuan band widening,” WSJ, April 16, 2012
  – The People’s Bank of China said Saturday it was widening the yuan’s daily trading band against the US dollar to 1.0% above and below a daily reference exchange rate, up from a previous band of 0.5%. It last expanded the dollar/yuan trading band from 0.3% in May 2007.
  – China’s move to widen the yuan trading band is a key step in its exchange rate reform, the Ministry of Commerce said Tuesday. Commerce ministry spokesman Shen Danyang said the yuan’s trend is set to become less predictable.
  • What’s going on here? Why?

In the news

• “Real rallies, Dow Jones, April 20, 2012
  – Brazil’s currency opened stronger Friday. The real appeared poised to bounce back from Thursday’s steep sell-off, when the currency market reacted strongly to indications that the Brazilian Central Bank could cut interest rates further. On Wednesday, central bankers reduced the benchmark Selic base interest rate to 9.0%, as expected.
  • What’s going on here? Why?

Heineken USA

• What’s your margin at the current exchange rate?
• How likely is a rise in the euro of 10-15%? A fall?
• What happens to your margin if the euro rises 15%?
• What response do you recommend?

Words & pictures

Words

• Alan Greenspan, “The euro as an international currency,” November 2001
  – Having endeavored to forecast exchange rates for more than half a century, I have developed significant humility about my ability in this area, a sentiment I suspect many in this room share.
Words

- Warren Buffett, Letter to Shareholders, 2005
  - Berkshire owned about $21.4 billion of foreign exchange contracts at yearend, spread among 12 currencies. Holding of this kind are a change for us. But the evidence grows that our trade [deficit] will put unremitting pressure on the dollar for many years to come.
- Positions closed 2 years later at a loss.

Words

- Jean-Paul Villain, head of strategy, ADIA, 2010
  - We came to a very firm conclusion: we simply don't know how to trade currencies.

Words

- Anonymous hedge fund trader, n+1, 2008:
  - From time to time, the dollar's been very weak; from time to time it's strong. ... Over the very long term, currency prices tend to be fairly stable and mean reverting. So the dollar's weak today, but that's no reason to believe it's going to be weak forever. It's amazing how many brilliant investors have gotten egg on their faces trading G-7 crosses.
- What is he saying? Does it make sense?

Yen per dollar

Source: Fed via FRED.

Dollars per euro

Source: Fed via FRED.

Pesos per dollar

Source: Fed via FRED.
Exchange rates

- Exchange rate terminology
  - $e$ = exchange rate: dollar price of one unit of euro
  - If $e$ rises, we say the dollar has depreciated (declined in value)
  - If $e$ falls, we say the dollar has appreciated (increased in value)
  - The reverse, of course, for the euro

- The facts
  - $e$'s for many currencies move around a lot
  - Annual std dev of stock market ~18%, dollar/euro ~12%

- Why?

Exchange rates and prices

- The idea
  - Exchange rates reflect differences in prices of goods
  - Prices look high in Paris, but if we convert them to dollars using the exchange rate, they should be about the same as New York
  - We call this “purchasing power parity” (PPP)

- What we’ll find
  - Crude approximation, but useful as long-term anchor

Exchange rates and prices

- Define
  - $P$ = domestic price (measured in dollars)
  - $P^*$ = foreign price (measured in euros)
  - $e$ = exchange rate (dollar price of one euro)

- Compare $P$ with $eP^*$
  \[ P \sim? eP^* \]
  \[ e \sim? P/P^* \]
  \[ RER = eP^*/P \sim? 1 \]

Exchange rates and prices

<table>

Dollars per euro

Source: Fed via FRED.

Pesos per dollar

Source: Fed via FRED.

Yuan per dollar

Source: Fed via FRED.
Exchange rates and prices

- Summary
- Dollar v peso
  - Large movements in P/P* reflected in e
  - Still lots of variation in RER
- Dollar v euro
  - Little variation in P/P*
  - Movements in e therefore similar to movements in RER

Exchange rates and prices

- One last try
- PPP says
  \[ e = \frac{P}{P^*} \]
  Rate of Change of e = Rate of Change of P/P*
- Let’s look at this over different time intervals

Exchange rates and prices

Source: Deutsche Bank FX Guide.

Exchange rates & interest rates

- Summary of PPP
- Approximation that works best
  - When there are large differences in inflation rates
  - And over long periods of time
Exchange rates and interest rates

- If two countries have different interest rates, the one with the higher rate will tend to appreciate
- R2 small (<0.05) but that’s enough to make money from
- More coming …

Exchange rates and interest rates

- The “carry trade”
  - Long position in high interest rate currency
  - Short position in low interest rate currency
  - Carry: collect difference in interest rates
  - Risk: the low-rate currency will rise
- Does it work?
  - Most of the time, yes

Exchange rates and interest rates

Source: Lustig and Verdelhan.

Exchange rates and interest rates

Exchange rates & anything else?
Exchange rates and …
- Trade balance?
- GDP growth?
- Stock market?

What have we learned
- Exchange rates are variable, affect costs, revenues, etc, in international transactions
- In the short run, most of this variation is unpredictable, even inexplicable
- In the long run, exchange rates roughly mirror ratios of prices (PPP)

For the ride home
- Is China’s currency “too cheap”?
- What does that mean?
- How could we tell?
