

APPLIED CORPORATE FINANCE: A BIG PICTURE VIEW

Aswath Damodaran

www.damodaran.com

What is corporate finance?

- Every decision that a business makes has financial implications, and any decision which affects the finances of a business is a corporate finance decision.
- Defined broadly, everything that a business does fits under the rubric of corporate finance.

First Principles

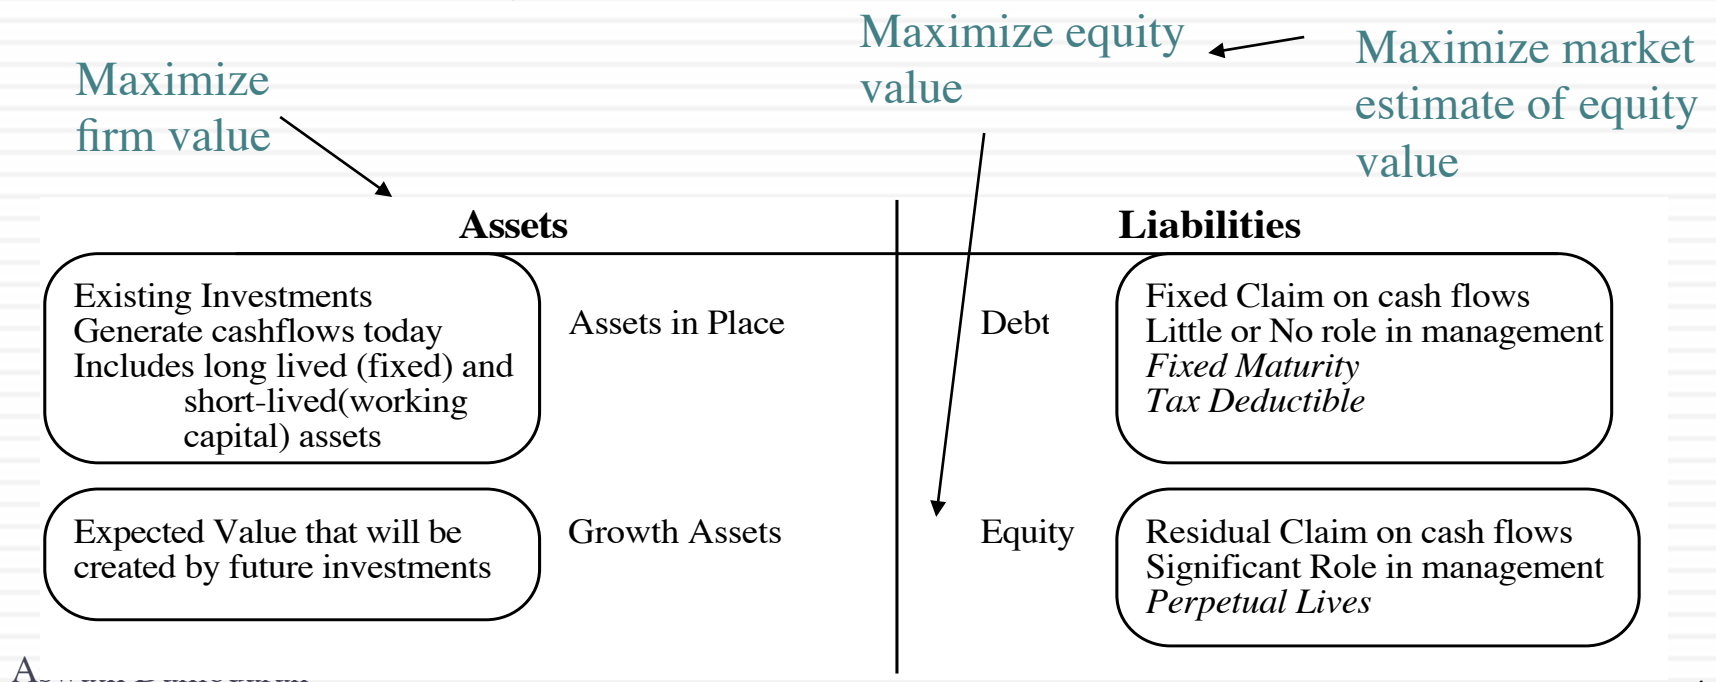

Corporate Finance: The Big Picture

The Objective in Decision Making

4

- In traditional corporate finance, the objective in decision making is to maximize the value of the firm.
- A narrower objective is to maximize stockholder wealth. When the stock is traded and markets are viewed to be efficient, the objective is to maximize the stock price.

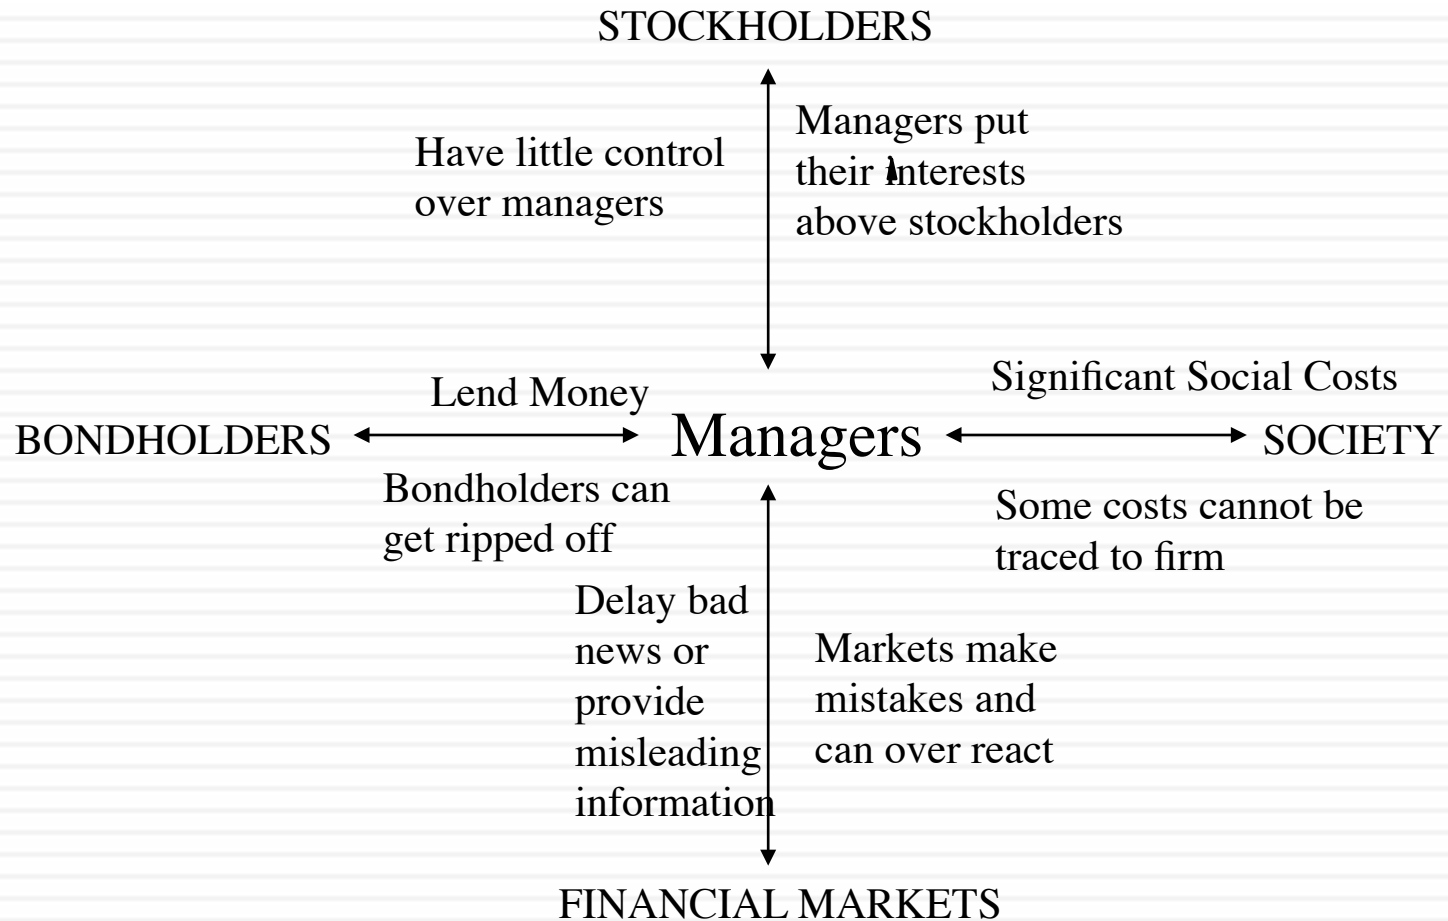

A

The Classical Objective Function

What can go wrong?

João Batista Cavaglieri (2013)
José Mauro Mettrau Carneiro da Cunha (2010)

Does CRH have an independent board?

- a. Yes
- b. No

Does CRH have an effective board?

- a. Yes
- b. No

When traditional corporate financial theory breaks down, the solution is:

9

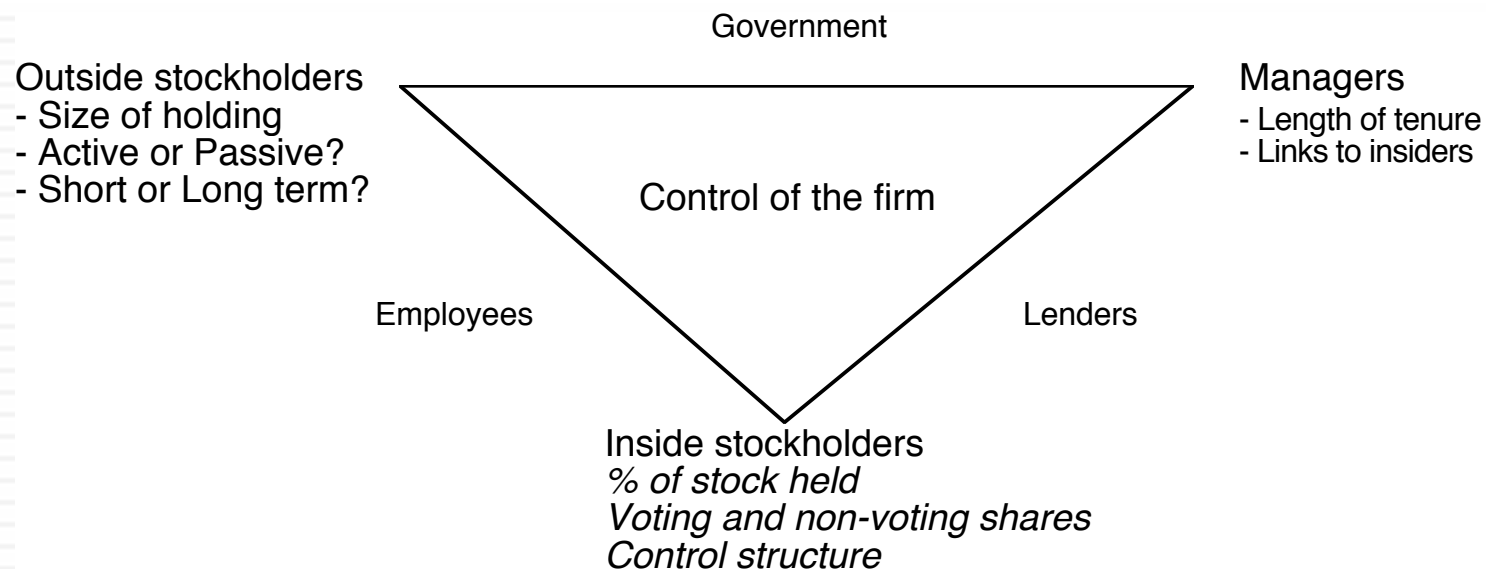

- To choose a different mechanism for corporate governance, i.e, assign the responsibility for monitoring managers to someone other than stockholders.
- To choose a different objective for the firm.
- To maximize stock price, but reduce the potential for conflict and breakdown:
 - ▣ Making managers (decision makers) and employees into stockholders
 - ▣ Protect lenders from expropriation
 - ▣ By providing information honestly and promptly to financial markets
 - ▣ Minimize social costs

A Market Based Solution

Application Test: Who owns/runs your firm?

- Who are the top stockholders in your firm?
- What are the potential conflicts of interests that you see emerging from this stockholding structure?

Splintering of Stockholders

Disney's top stockholders in 2003

Vale: Shareholder Ownership Structure

Vale has eleven members on its board of directors, ten of whom were nominated by Valepar and the board was chaired by Don Conrado, the CEO of Valepar.

First Principles

Corporate Finance: The Big Picture

What is Risk?

- Risk, in traditional terms, is viewed as a ‘negative’. Webster’s dictionary, for instance, defines risk as “exposing to danger or hazard”. The Chinese symbols for risk, reproduced below, give a much better description of risk:

危險

- The first symbol is the symbol for “danger”, while the second is the symbol for “opportunity”, making risk a mix of danger and opportunity. You cannot have one, without the other.

Alternatives to the CAPM

Step 1: Defining Risk

Step 2: Differentiating between Rewarded and Unrewarded Risk

Risk that is specific to investment (Firm Specific)

Can be diversified away in a diversified portfolio

1. each investment is a small proportion of portfolio
2. risk averages out across investments in portfolio

The marginal investor is assumed to hold a “diversified” portfolio. Thus, only market risk will be rewarded and priced.

Risk that affects all investments (Market Risk)

Cannot be diversified away since most assets are affected by it.

Step 3: Measuring Market Risk

The CAPM	The APM	Multi-Factor Models	Proxy Models
<p>If there is</p> <ol style="list-style-type: none"> 1. no private information 2. no transactions cost <p>the optimal diversified portfolio includes every traded asset. Everyone will hold this <u>market portfolio</u></p> <p>Market Risk = Risk added by any investment to the market portfolio:</p>	<p>If there are no arbitrage opportunities then the market risk of any asset must be captured by betas relative to factors that affect all investments.</p> <p>Market Risk = Risk exposures of any asset to market factors</p>	<p>Since market risk affects most or all investments, it must come from macro economic factors.</p> <p>Market Risk = Risk exposures of any asset to macro economic factors.</p>	<p>In an efficient market, differences in returns across long periods must be due to market risk differences. Looking for variables correlated with returns should then give us proxies for this risk.</p> <p>Market Risk = Captured by the Proxy Variable(s)</p>
Beta of asset relative to Market portfolio (from a regression)	Betas of asset relative to unspecified market factors (from a factor analysis)	Betas of assets relative to specified macro economic factors (from a regression)	Equation relating returns to proxy variables (from a regression)

Inputs required to use the CAPM -

- The capital asset pricing model yields the following expected return:
 - $\text{Expected Return} = \text{Riskfree Rate} + \text{Beta} * (\text{Expected Return on the Market Portfolio} - \text{Riskfree Rate})$
- To use the model we need three inputs:
 - a. The current risk-free rate
 - b. The expected market risk premium (the premium expected for investing in risky assets (market portfolio) over the riskless asset)
 - c. The beta of the asset being analyzed.

I. A Riskfree Rate

18

- On a riskfree asset, the actual return is equal to the expected return. Therefore, there is no variance around the expected return.
- For an investment to be riskfree, then, it has to have
 - ▣ No default risk
 - ▣ No reinvestment risk
- 1. Time horizon matters: Thus, the riskfree rates in valuation will depend upon when the cash flow is expected to occur and will vary across time.
- 2. Not all government securities are riskfree: Some governments face default risk and the rates on bonds issued by them will not be riskfree.
- The conventional practice of estimating riskfree rates is to use the government bond rate, with the government being the one that is in control of issuing that currency. **In November 2013**, for instance, the rate on a ten-year US treasury bond (2.75%) is used as the risk free rate in US dollars.

What if there is no default-free entity?

Risk free rates in November 2013

PB Page 14-21

- If the government is perceived to have default risk, the government bond rate will have a default spread component in it and not be riskfree. There are three choices we have, when this is the case.
 - Adjust the local currency government borrowing rate for default risk to get a riskless local currency rate.
 - In November 2013, the Brazilian government rupee bond rate was 12.18%. the local currency rating from Moody's was Baa3 and the default spread for a Baa2 rated country bond was 2%.
Riskfree rate in \$R = 12.18% - 2.00% = 9.18%
 - Do the analysis in an alternate currency, where getting the riskfree rate is easier. With Vale in 2013, we could chose to do the analysis in US dollars (rather than estimate a riskfree rate in R\$). The riskfree rate is then the US treasury bond rate.
 - Do your analysis in real terms, in which case the riskfree rate has to be a real riskfree rate. The inflation-indexed treasury rate is a measure of a real riskfree rate.

Risk free rates by currency: January 2015

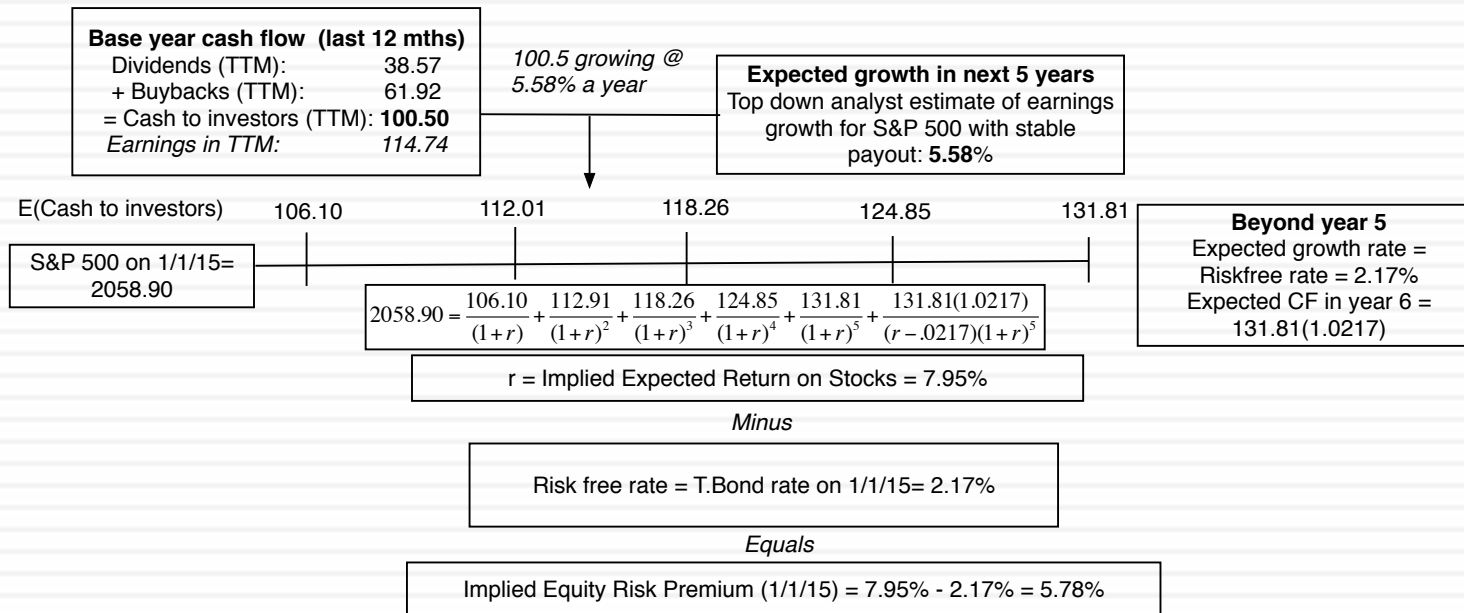

Riskfree Rates: January 2015

II. The Equity Risk Premium

	Arithmetic Average		Geometric Average	
	Stocks - T. Bills	Stocks - T. Bonds	Stocks - T. Bills	Stocks - T. Bonds
1928-2014	8.00%	6.25%	6.11%	4.60%
	2.17%	2.32%		
1965-2014	6.19%	4.12%	4.84%	3.14%
	2.42%	2.74%		
2005-2014	7.94%	4.06%	6.18%	2.73%
	6.05%	8.65%		

Historical premium for the US

Country Risk: Look at a country's bond rating and default spreads as a start

- In this approach, the country equity risk premium is set equal to the default spread for the country, estimated in one of three ways:
 - The default spread on a dollar denominated bond issued by the country. (In January 2015, that spread was 1.55% for the Brazilian \$ bond)
 - The sovereign CDS spread for the country. In January 2015, the ten year CDS spread for Brazil was 2.86%.
 - The default spread based on the local currency rating for the country. Brazil's sovereign local currency rating is Baa2 and the default spread for a Baa2 rated sovereign was about 1.90% in January 2015.
- Many analysts add this default spread to the US risk premium to come up with a risk premium for a country. This would yield a risk premium of 7.65% for Brazil, if we use 5.75% as the US risk premium and the default spread based on the rating.

Beyond the default spread

- Country ratings measure default risk. While default risk premiums and equity risk premiums are highly correlated, one would expect equity spreads to be higher than debt spreads.
- Another is to multiply the bond default spread by the relative volatility of stock and bond prices in that market. Using this approach for Brazil in November 2013, you would get:
 - Country Equity risk premium = Default spread on country bond* $\frac{\sigma_{\text{Country Equity}}}{\sigma_{\text{Country Bond}}}$
 - Standard Deviation in Bovespa (Equity) = 21%
 - Standard Deviation in Brazil government bond = 14%
 - Default spread on Brazilian \$ bond = 2.00%
 - Brazil Country Risk Premium = 2.00% (21%/14%) = 2.85%
 - Brazil Total ERP = Mature Market Premium + CRP = 5.5% + 3.00% = 8.50%

Estimating ERP for Disney: November 2013

- Incorporation: The conventional practice on equity risk premiums is to estimate an ERP based upon where a company is incorporated. Thus, the cost of equity for Disney would be computed based on the US equity risk premium, because it is a US company, and the Brazilian ERP would be used for Vale, because it is a Brazilian company.
- Operations: The more sensible practice on equity risk premium is to estimate an ERP based upon where a company operates. For Disney in 2013:

<i>Region/ Country</i>	<i>Proportion of Disney's Revenues</i>	<i>ERP</i>
US& Canada	82.01%	5.50%
Europe	11.64%	6.72%
Asia-Pacific	6.02%	7.27%
Latin America	0.33%	9.44%
Disney	100.00%	5.76%

Vale: Equity Risk Premium (based on revenues)

<i>Region/ Country</i>	<i>Weight</i>	<i>ERP</i>
US & Canada	4.90%	5.50%
Brazil	16.90%	8.50%
Rest of Latin America	1.70%	10.09%
China	37.00%	6.94%
Japan	10.30%	6.70%

III. The Beta

- The beta of a stock (asset) measures its exposure to market risk, i.e., the risk that cannot be diversified away by the marginal investors. It is therefore a measure of exposure to broad macroeconomic risk factors.
- The beta of a stock is standardized around one.
 - A beta that is greater than one indicates above-average risk
 - A beta that is close to one indicates average risk
 - A beta less than one indicates below average risk
 - A beta below zero is a indication of a market risk reducing investment
- Implications:
 - The weighted average beta of stocks in any market (even the most risky ones) is one. Thus, beta cannot carry the weight of country risk.
 - A stock can be risky and have a low beta, if most of the risk in the stock is firm-specific risk.

Measuring Beta

- The standard procedure is to regress stock returns (R_j) against market returns (R_m):

$$R_j = a + b R_m$$

- Risk measure: The slope of the regression (b) corresponds to the beta of the stock, and measures the riskiness of the stock. The regression yields a range on the beta that can be computed from the standard error of the beta estimate.
 - ▣ Plus (minus) one standard errors: 67% confidence interval
 - ▣ Plus (minus) two standard errors: 95% confidence interval
- Performance measure: The intercept (a) of the regression is a measure of how well or badly the stock performed during the period of the regression, after adjusting for risk and market performance. If the regression is run with raw returns, the intercept has to be compared to $R_f (1 - \text{Beta})$ to measure what's called **Jensen's alpha ($a - R_f (1 - \text{Beta})$)**
 - $a > R_f (1 - b)$: Positive Jensen's alpha = Stock did better than expected during regression period
 - $a = R_f (1 - b)$: Zero Jensen's alpha = Stock did better than expected during regression period
 - $a < R_f (1 - b)$: Negative Jensen's alpha = Stock did better than expected during regression period
- Risk source: The R squared (R^2) of the regression provides an estimate of the proportion of the risk (variance) of a firm that can be attributed to market risk.

Disney: Beta Regression

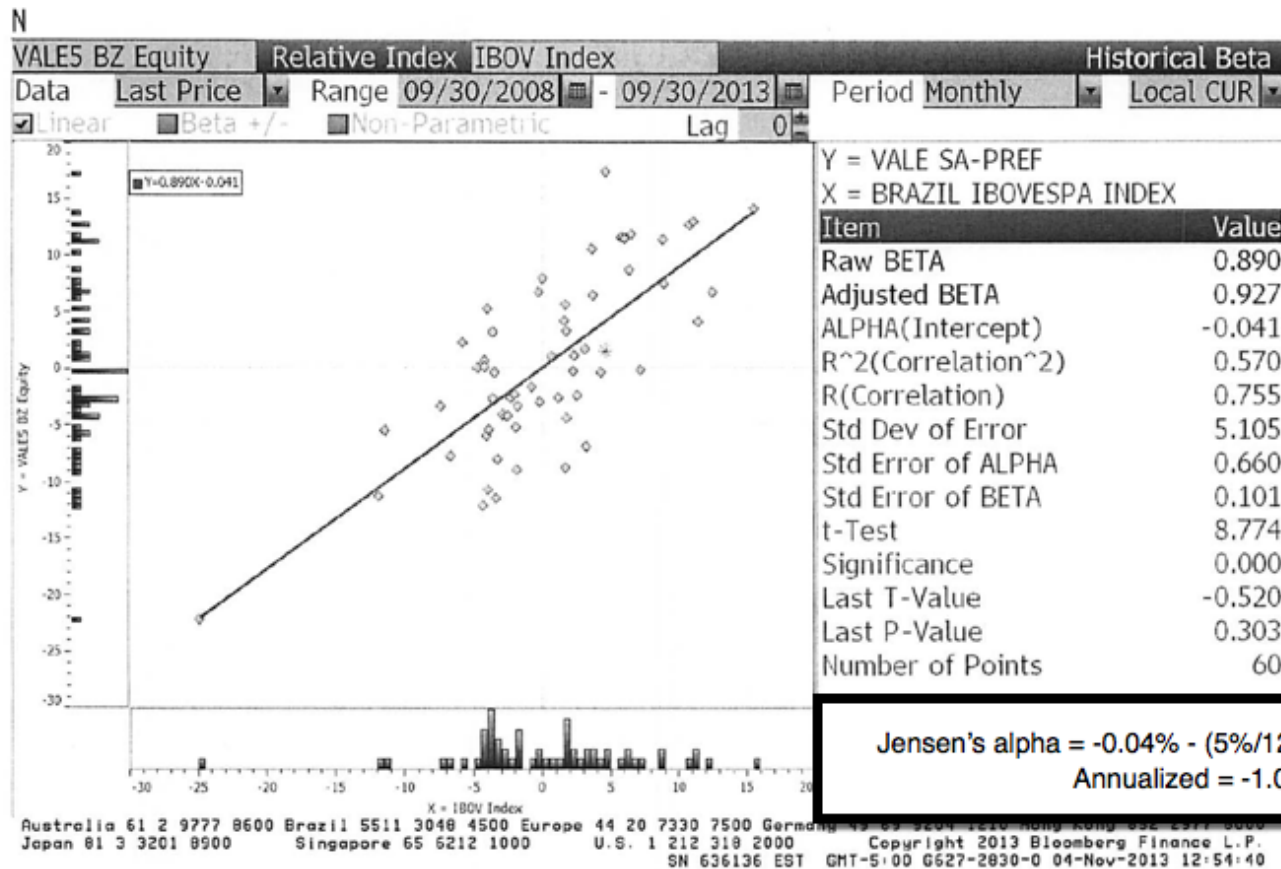

Beta = 1.25

73% of risk is from market

67% (95%) range on beta: 1.15 - 1.35 (1.05-1.45)

Jensen's alpha = 0.57% - (0.5%/12) (1-1.245) = 0.58%
Annualized = 7.19%

Vale: Beta Regression

Beta = 0.89

57% of risk is
market risk

67% (95%)
range for beta:
0.79-0.99 (0.69-
1.09)

Jensen's alpha = -0.04% - (5%/12) (1-0.89) = -0.09%
Annualized = -1.04%

And another regression...

Beta = 1.37

41% of risk is from market risk

67% (95%)
range for beta:
1.16 - 1.58
(0.95- 1.79)

Jensen's alpha = $-0.75\% - (0.5\%/12) (1-1.37) = -.73\%$
Annualized = -8.43%

The problem with regression betas

- They are backward looking: By definition, a regression beta is backward looking because it is computed based upon past returns. Consequently, if a company's business mix or financial leverage has changed during the regression period, the regression beta (even if well estimated) is no longer operational.
- They are subject to manipulation: Changing the market index used, the time period of the regression or even the return intervals (daily, weekly, monthly) can yield very different regression output.
- They are noisy: A regression slope (which is what we use as a beta) comes with a standard error, and if you regress a stock against a broad enough index, the regression beta should have a high standard error (it is a feature, not a bug)>

Determinants of Betas

Disney's business betas

Unlevered Beta
 $(1 - \text{Cash}/ \text{Firm Value})$

<i>Business</i>	<i>Comparable firms</i>	<i>Sample size</i>	<i>Median Beta</i>	<i>Median D/E</i>	<i>Median Tax rate</i>	<i>Company Unlevered Beta</i>	<i>Median Cash/ Firm Value</i>	<i>Business Unlevered Beta</i>

<i>Vale Operations</i>			<i>0.8440</i>	<i>\$47,151</i>		<i>\$106,543</i>	<i>100.00%</i>

Business	Unlevered beta	D/E ratio	Levered beta	Risk free rate	ERP	Cost of Equity
Metals & Mining	0.86	54.99%	1.1657	2.75%	7.38%	11.35%
Iron Ore	0.83	54.99%	1.1358	2.75%	7.38%	11.13%
Fertilizers	0.99	54.99%	1.3493	2.75%	7.38%	12.70%
Logistics	0.75	54.99%	1.0222	2.75%	7.38%	10.29%
Vale Operations	0.84	54.99%	1.1503	2.75%	7.38%	11.23%

Discussion Issue

- The head of the fertilizer business has come to you with a new investment in **Brazil** that he would like you to fund. He claims that his analysis of the movie indicates that it will generate a return on equity of 12% (in **Brazilian Reais**). Would you fund it?
 - a. Yes.
 - b. No.

What return on equity would this investment need to make to be justified? Why? (The inflation rate in Reais is 9% whereas the inflation rate in US dollars is 2%).

Vale: Cost of Equity for a Brazilian fertilizer investment in nominal \$R

- To convert a discount rate in one currency to another, all you need are expected inflation rates in the two currencies.

$$(1 + \$ \text{ Cost of Equity}) \frac{(1 + \text{Inflation Rate}_{\text{Brazil}})}{(1 + \text{Inflation Rate}_{\text{US}})} - 1$$

- To estimate the cost of equity that Vale should use for a fertilizer investment in Brazil, let's start by estimating the cost of equity in US dollars:

$$\text{Cost of equity} = 2.75\% + 1.3493 (8.50\%) = 14.22\%$$

The risk free rate is in US dollars, the beta is that of the fertilizer business and the equity risk premium is for Brazil.

- $$\begin{aligned} \text{Cost of Equity}_{\text{Nominal R\$}} &= (1 + \text{Cost of Equity}_{\text{US \$}}) \frac{(1 + \text{Expected Inflation}_{\text{R\$}})}{(1 + \text{Expected Inflation}_{\text{US \$}})} - 1 \\ &= (1.1422123) \frac{(1.09)}{(1.02)} - 1 = 22.06\% \end{aligned}$$

Estimating the Cost of Debt

- If the firm has bonds outstanding, and the bonds are traded, the yield to maturity on a long-term, straight (no special features) bond can be used as the interest rate.
- If the firm is rated, use the rating and a typical default spread on bonds with that rating to estimate the cost of debt.
- If the firm is not rated,
 - and it has recently borrowed long term from a bank, use the interest rate on the borrowing or
 - estimate a synthetic rating for the company, and use the synthetic rating to arrive at a default spread and a cost of debt
- The cost of debt has to be estimated in the same currency as the cost of equity and the cash flows in the valuation.

Estimating Synthetic Ratings

- The rating for a firm can be estimated using the financial characteristics of the firm. In its simplest form, we can use just the interest coverage ratio:
Interest Coverage Ratio = EBIT / Interest Expenses
- The interest coverage ratio measures how much operating income a firm generates relative to a dollar of interest expenses.

Company	Operating income	Interest Expense	Interest coverage ratio
Disney	\$10,023	\$444	22.57
Vale	\$15,667	\$1,342	11.67

Interest Coverage Ratios, Ratings and Default Spreads- November 2013

<i>Large cap (>\$5 billion)</i>	<i>Small cap or risky (<\$5 billion)</i>	<i>Rating is (S&P/ Moody's)</i>	<i>Spread (11/13)</i>
>8.50	>12.5	Aaa/AAA	0.40%
6.5-8.5	9.5-12.5	Aa2/AA	0.70%
5.5-6.5	7.5-9.5	A1/A+	0.85%
4.25-5.5	6-7.5	A2/A	1.00%
3-4.25	4.5-6	A3/A-	1.30%

0.8-1.25	1.25-1.5	Caa/CCC	8.75%
0.65-0.8	0.8-1.25	Ca2/CC	9.50%
0.2-0.65	0.5-0.8	C2/C	10.50%
<0.2	<0.5	D2/D	12.00%

Disney: Large cap, developed 22.57 → AAA
Vale: Large cap, emerging 11.67 → AA

Synthetic versus Actual Ratings: Rated Firms

- Disney’s synthetic rating is AAA, whereas its actual rating is A. The difference can be attributed to any of the following:
 - Synthetic ratings reflect only the interest coverage ratio whereas actual ratings incorporate all of the other ratios and qualitative factors
 - Synthetic ratings do not allow for sector-wide biases in ratings
 - Synthetic rating was based on 2013 operating income whereas actual rating reflects normalized earnings
- Vale’s synthetic rating is AA, but the actual rating for dollar debt is A-. The biggest factor behind the difference is the presence of country risk, since Vale is probably being rated lower for being a Brazil-based corporation.

Company	S&P Rating	Risk-Free Rate	Default Spread	Cost of Debt	Tax Rate	After-Tax Cost of Debt
Disney	A	2.75% (US \$)	1.00%	3.75%	36.1%	2.40%
Vale	A-	2.75% (US \$)	1.30%	4.05%	34%	2.67%

Divisional Costs of Capital: Disney and Vale

Disney

	Cost of equity	Cost of debt	Marginal tax rate	After-tax cost of debt	Debt ratio	Cost of capital
Media Networks	9.07%	3.75%	36.10%	2.40%	9.12%	8.46%

Vale Operations	11.23%	2.67%	35.48%	8.20%	15.62%

Back to First Principles

Chapters 3 & 4: Risk, Financing Mix and Hurdle Rates

Measuring Returns Right: The Basic Principles

- Use cash flows rather than earnings. You cannot spend earnings.
- Use “incremental” cash flows relating to the investment decision, i.e., cashflows that occur as a consequence of the decision, rather than total cash flows.
- Use “time weighted” returns, i.e., value cash flows that occur earlier more than cash flows that occur later.

The Return Mantra: “Time-weighted, Incremental Cash Flow Return”

Earnings versus Cash Flows: A Disney Theme Park

- The theme parks to be built near Rio, modeled on Euro Disney in Paris and Disney World in Orlando.
- The complex will include a “Magic Kingdom” to be constructed, beginning immediately, and becoming operational at the beginning of the second year, and a second theme park modeled on Epcot Center at Orlando to be constructed in the second and third year and becoming operational at the beginning of the fourth year.
- The earnings and cash flows are estimated in nominal U.S. Dollars.

Step 1: Estimate Accounting Earnings on Project

	0	1	2	3	4	5	6	7	8	9	10
Magic Kingdom - Revenues		\$0	\$1,000	\$1,400	\$1,700	\$2,000	\$2,200	\$2,420	\$2,662	\$2,928	\$2,987
Epcot Rio - Revenues		\$0	\$0	\$0	\$300	\$500	\$550	\$605	\$666	\$732	\$747
Resort & Properties - Revenues		\$0	\$250	\$350	\$500	\$625	\$688	\$756	\$832	\$915	\$933
Total Revenues			\$1,250	\$1,750	\$2,500	\$3,125	\$3,438	\$3,781	\$4,159	\$4,575	\$4,667
Magic Kingdom – Direct Expenses		\$0	\$600	\$840	\$1,020	\$1,200	\$1,320	\$1,452	\$1,597	\$1,757	\$1,792
Epcot Rio – Direct Expenses		\$0	\$0	\$0	\$180	\$300	\$330	\$363	\$399	\$439	\$448
Resort & Property – Direct Expenses		\$0	\$188	\$263	\$375	\$469	\$516	\$567	\$624	\$686	\$700
Total Direct Expenses			\$788	\$1,103	\$1,575	\$1,969	\$2,166	\$2,382	\$2,620	\$2,882	\$2,940
Depreciation & Amortization		\$50	\$425	\$469	\$444	\$372	\$367	\$364	\$364	\$366	\$368
Allocated G&A Costs		\$0	\$188	\$263	\$375	\$469	\$516	\$567	\$624	\$686	\$700
Operating Income		-\$50	-\$150	-\$84	\$106	\$315	\$389	\$467	\$551	\$641	\$658
Taxes		-\$18	-\$54	-\$30	\$38	\$114	\$141	\$169	\$199	\$231	\$238
Operating Income after Taxes		-\$32	-\$96	-\$54	\$68	\$202	\$249	\$299	\$352	\$410	\$421

Direct expenses: 60% of revenues for theme parks, 75% of revenues for resort properties

Allocated G&A: Company G&A allocated to project, based on projected revenues. Two thirds of expense is fixed, rest is variable.

Taxes: Based on marginal tax rate of 36.1%

And the Accounting View of Return

Year	After-tax Operating Income	BV of pre-project investment	BV of fixed assets	BV of Working capital	BV of Capital	Average BV of Capital	ROC(a)	ROC(b)
0		500	2000	0	\$2,500			
1	-\$32	\$450	\$3,000	\$0	\$3,450	\$2,975	-1.07%	-1.28%
2	-\$96	\$400	\$3,813	\$63	\$4,275	\$3,863	-2.48%	-2.78%
3	-\$54	\$350	\$4,145	\$88	\$4,582	\$4,429	-1.22%	-1.26%
4	\$68	\$300	\$4,027	\$125	\$4,452	\$4,517	1.50%	1.48%
5	\$202	\$250	\$3,962	\$156	\$4,368	\$4,410	4.57%	4.53%
6	\$249	\$200	\$3,931	\$172	\$4,302	\$4,335	5.74%	5.69%

8	\$352	\$100	\$3,946	\$208	\$4,254	\$4,262	8.26%	8.24%
9	\$410	\$50	\$3,978	\$229	\$4,257	\$4,255	9.62%	9.63%
10	\$421	\$0	\$4,010	\$233	\$4,243	\$4,250	9.90%	9.89%
Average							4.18%	4.11%

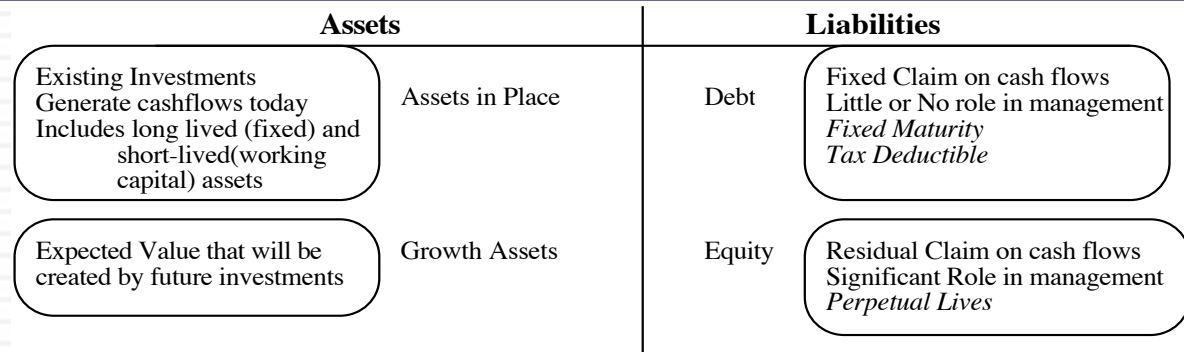

- (a) Based upon book capital at the start of each year
- (b) Based upon average book capital over the year

Estimating a hurdle rate for Rio Disney

- We did estimate a cost of capital of 6.61% for the Disney theme park business, using a bottom-up levered beta of 0.7537 for the business.
- This cost of equity may not adequately reflect the additional risk associated with the theme park being in an emerging market.
- The only concern we would have with using this cost of equity for this project is that it may not adequately reflect the additional risk associated with the theme park being in an emerging market (Brazil). We first computed the Brazil country risk premium (by multiplying the default spread for Brazil by the relative equity market volatility) and then re-estimated the cost of equity:
 - Country risk premium for Brazil = 5.5% + 3% = 8.5%
 - Cost of Equity in US\$ = 2.75% + 0.7537 (8.5%) = 9.16%
- Using this estimate of the cost of equity, Disney's theme park debt ratio of 10.24% and its after-tax cost of debt of 2.40% (see chapter 4), we can estimate the cost of capital for the project:
 - Cost of Capital in US\$ = 9.16% (0.8976) + 2.40% (0.1024) = 8.46%

A Tangent: From New to Existing Investments: ROC for the entire firm

How “good” are the existing investments of the firm?

Measuring ROC for existing investments..

Company	EBIT (1-t)	BV of Debt	BV of Equity	Cash	BV of Capital	Return on Capital	Cost of Capital	ROC - Cost of Capital
Disney	\$6,920	\$16,328	\$41,958	\$3,387	\$54,899	12.61%	7.81%	4.80%
Vale	\$12,432	\$49,246	\$75,974	\$5,818	\$119,402	10.41%	8.20%	2.22%

Old wine in a new bottle.. Another way of presenting the same results...

- The key to value is earning excess returns. Over time, there have been attempts to restate this obvious fact in new and different ways. For instance, Economic Value Added (EVA) developed a wide following in the the 1990s:
- $EVA = (ROC - \text{Cost of Capital}) (\text{Book Value of Capital Invested})$
- The excess returns for the four firms can be restated as follows:

Company	ROC - Cost of Capital	BV of Capital	EVA
Disney	4.80%	\$54,899	\$2,632
Vale	2.22%	\$119,402	\$2,645

The cash flow view of this project..

	0	1	2	3	4	5	6	7	8	9	10
After-tax Operating Income		-\$32	-\$96	-\$54	\$68	\$202	\$249	\$299	\$352	\$410	\$421

\$ 500 million has already been spent & \$ 50 million in depreciation will exist anyway

2/3rd of allocated G&A is fixed.
Add back this amount (1-t)
Tax rate = 36.1%

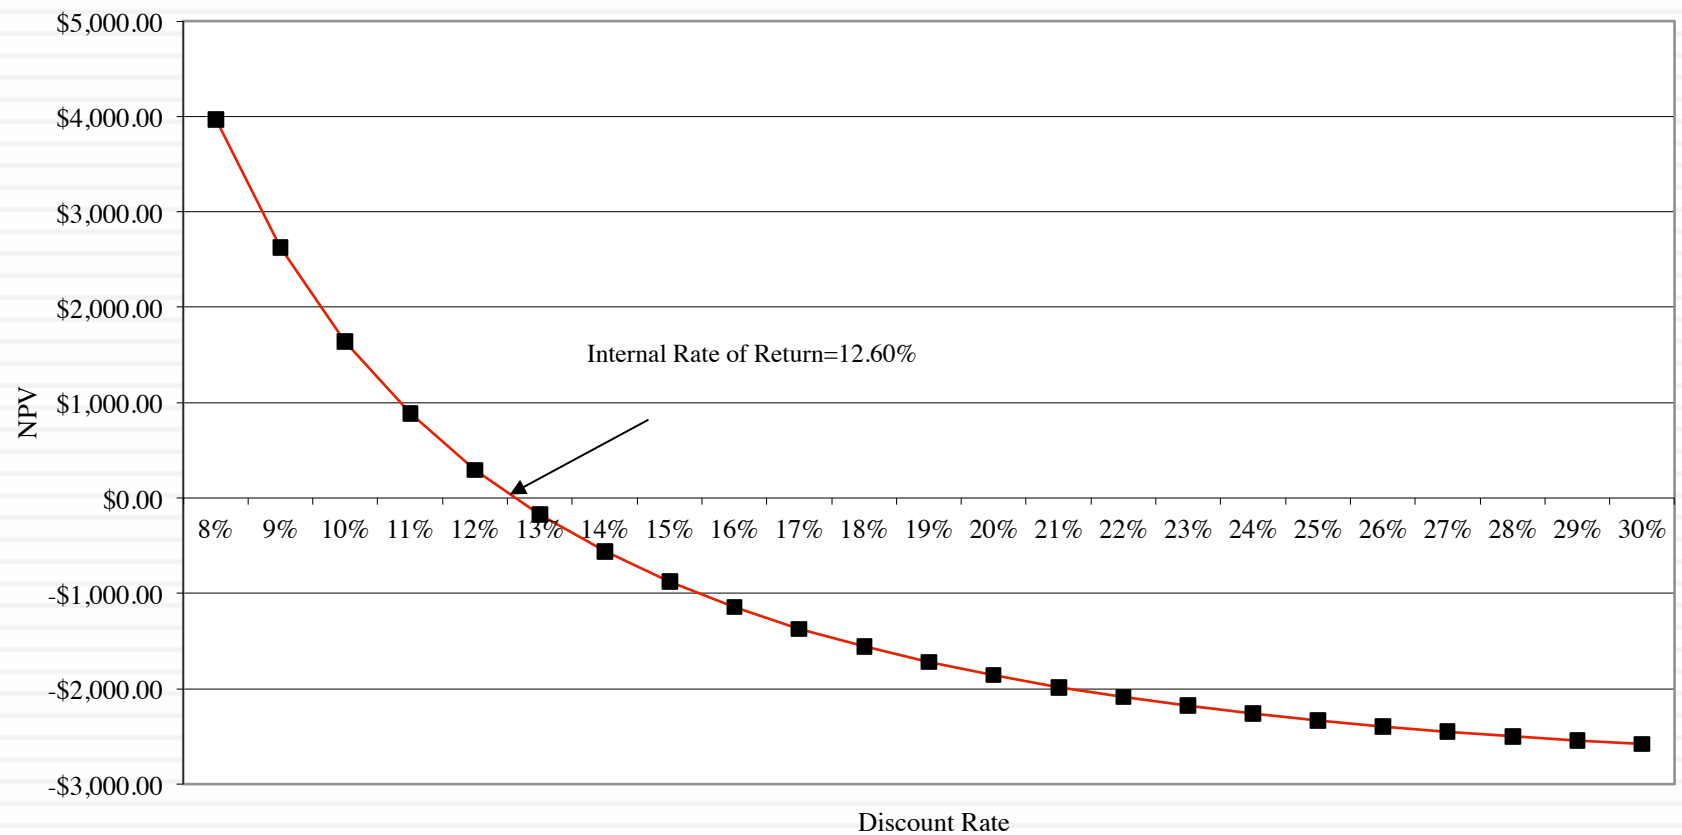

Closure on Cash Flows

- In a project with a finite and short life, you would need to compute a salvage value, which is the expected proceeds from selling all of the investment in the project at the end of the project life. It is usually set equal to book value of fixed assets and working capital
- In a project with an infinite or very long life, we compute cash flows for a reasonable period, and then compute a terminal value for this project, which is the present value of all cash flows that occur after the estimation period ends..
- Assuming the project lasts forever, and that cash flows after year 10 grow 2% (the inflation rate) forever, the present value at the end of year 10 of cash flows after that can be written as:
 - Terminal Value in year 10= $CF \text{ in year } 11 / (\text{Cost of Capital} - \text{Growth Rate})$
 $= 715 (1.02) / (.0846 - .02) = \$ 11,275 \text{ million}$

Which yields a NPV of..

Year	Annual Cashflow	Terminal Value	Present Value
0	-\$2,000		-\$2,000
1	-\$1,000		-\$922
2	-\$859		-\$730

				R\$ 7,745.43

NPV = R\$ 7,745/2.35= \$ 3,296 Million
 NPV is equal to NPV in dollar terms

Equity Analysis: The Parallels

59

- The investment analysis can be done entirely in equity terms, as well. The returns, cashflows and hurdle rates will all be defined from the perspective of equity investors.
- If using accounting returns,
 - ▣ Return will be Return on Equity (ROE) = Net Income/BV of Equity
 - ▣ ROE has to be greater than cost of equity
- If using discounted cashflow models,
 - ▣ Cashflows will be cashflows after debt payments to equity investors
 - ▣ Hurdle rate will be cost of equity

A Vale Iron Ore Mine in Canada Investment Operating Assumptions

60

1. The mine will require an initial investment of \$1.25 billion and is expected to have a production capacity of 8 million tons of iron ore, once established. The initial investment of \$1.25 billion will be depreciated over ten years, using double declining balance depreciation, down to a salvage value of \$250 million at the end of ten years.
2. The mine will start production midway through the next year, producing 4 million tons of iron ore for year 1, with production increasing to 6 million tons in year 2 and leveling off at 8 million tons thereafter (until year 10). The price, in US dollars per ton of iron ore is currently \$100 and is expected to keep pace with inflation for the life of the plant.
3. The variable cost of production, including labor, material and operating expenses, is expected to be \$45/ton of iron ore produced and there is a fixed cost of \$125 million in year 1. Both costs, which will grow at the inflation rate of 2% thereafter. The costs will be in Canadian dollars, but the expected values are converted into US dollars, assuming that the current parity between the currencies (1 Canadian \$ = 1 US dollar) will continue, since interest and inflation rates are similar in the two currencies.
4. The working capital requirements are estimated to be 20% of total revenues, and the investments have to be made at the beginning of each year. At the end of the tenth year, it is anticipated that the entire working capital will be salvaged.
5. Vale's corporate tax rate of 34% will apply to this project as well.

Financing Assumptions

61

Vale plans to borrow \$0.5 billion at its current cost of debt of 4.05% (based upon its rating of A-), using a ten-year term loan (where the loan will be paid off in equal annual increments). The breakdown of the payments each year into interest and principal are provided below:

Year	Beginning Debt	Interest expense	Principal Repaid	Total Payment	Ending Debt
1	\$500.00	\$20.25	\$41.55	\$61.80	\$458.45
2	\$458.45	\$18.57	\$43.23	\$61.80	\$415.22
3	\$415.22	\$16.82	\$44.98	\$61.80	\$370.24
4	\$370.24	\$14.99	\$46.80	\$61.80	\$323.43
5	\$323.43	\$13.10	\$48.70	\$61.80	\$274.73
6	\$274.73	\$11.13	\$50.67	\$61.80	\$224.06
7	\$224.06	\$9.07	\$52.72	\$61.80	\$171.34
8	\$171.34	\$6.94	\$54.86	\$61.80	\$116.48
9	\$116.48	\$4.72	\$57.08	\$61.80	\$59.39
10	\$59.39	\$2.41	\$59.39	\$61.80	\$0.00

The Hurdle Rate

- The analysis is done US dollar terms and to equity investors. Thus, the hurdle rate has to be a US \$ cost of equity.
- In the earlier section, we estimated costs of equity, debt and capital in US dollars and \$R for Vale’s iron ore business.

<i>Business</i>	<i>Cost of equity</i>	<i>After-tax cost of debt</i>	<i>Debt ratio</i>	<i>Cost of capital (in US\$)</i>	<i>Cost of capital (in \$R)</i>
Metals & Mining	11.35%	2.67%	35.48%	8.27%	15.70%
Iron Ore	11.13%	2.67%	35.48%	8.13%	15.55%

Dealing with Macro Uncertainty: The Effect of Iron Ore Price

67

- Like the Disney Theme Park, the Vale Iron Ore Mine's actual value will be buffeted as the variables change. The biggest source of variability is an external factor –the price of iron ore.

Vale Paper Plant: Effect of Changing Iron Ore Prices

And Exchange Rates...

Exchange Rate effects on Iron Ore Plant

Should you hedge?

69

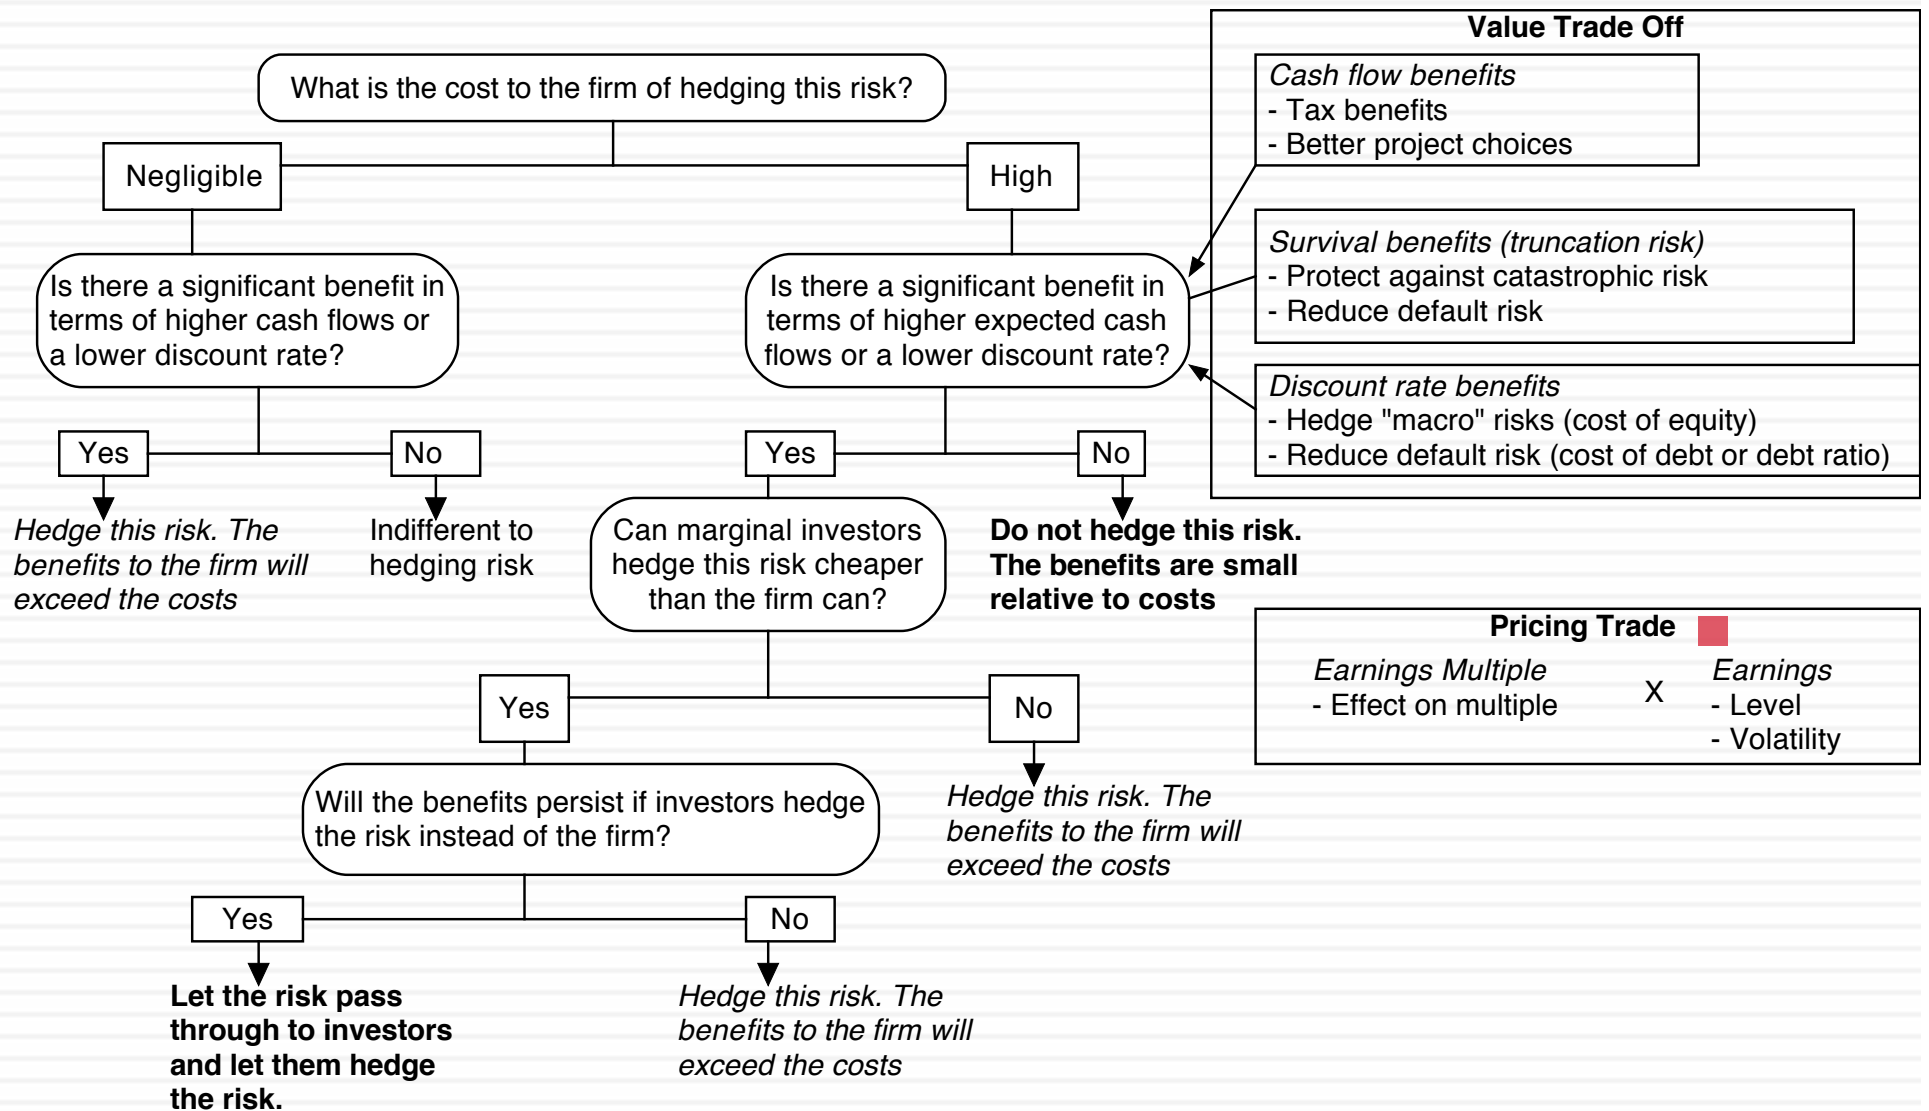

- The value of this mine is very much a function iron ore prices. There are futures, forward and option markets iron ore that Vale can use to hedge against price movements. Should it?
 - ▣ Yes
 - ▣ No

Explain.

- The value of the mine is also a function of exchange rates. There are forward, futures and options markets on currency. Should Vale hedge against exchange rate risk?
 - ▣ Yes
 - ▣ No

Explain.

- On the last question, would your answer have been different if the mine were in Brazil?
 - ▣ Yes
 - ▣ No

Value Trade Off

First Principles

Chapters 7 & 8: Financing Choices and an Optimal Mix

Debt: Summarizing the trade off

<i>Advantages of Debt</i>	<i>Disadvantages of debt</i>
<p>1. Tax Benefit: Interest expenses on debt are tax deductible but cash flows to equity are generally not. <i>Implication: The higher the marginal tax rate, the greater the benefits of debt.</i></p>	<p>1. Expected Bankruptcy Cost: The expected cost of going bankrupt is a product of the probability of going bankrupt and the cost of going bankrupt. The latter includes both direct and indirect costs. The probability of going bankrupt will be higher in businesses with more volatile earnings and the cost of bankruptcy will also vary across businesses. <i>Implication:</i> <ol style="list-style-type: none"> <i>Firms with more stable earnings should borrow more, for any given level of earnings.</i> <i>Firms with lower bankruptcy costs should borrow more, for any given level of earnings.</i> </p>
<p>2. Added Discipline: Borrowing money may force managers to think about the consequences of the investment decisions a little more carefully and reduce bad investments. <i>Implication: As the separation between managers and stockholders increases, the benefits to using debt will go up.</i></p>	<p>2. Agency Costs: Actions that benefit equity investors may hurt lenders. The greater the potential for this conflict of interest, the greater the cost borne by the borrower (as higher interest rates or more covenants). <i>Implication: Firms where lenders can monitor/ control how their money is being used should be able to borrow more than firms where this is difficult to do.</i></p>
	<p>3. Loss of flexibility: Using up available debt capacity today will mean that you cannot draw on it in the future. This loss of flexibility can be disastrous if funds are needed and access to capital is shut off. <i>Implication:</i> <ol style="list-style-type: none"> <i>Firms that can forecast future funding needs better should be able to borrow more.</i> <i>Firms with better access to capital markets should be more willing to borrow more today.</i> </p>

Mechanics of Cost of Capital Estimation

1. Estimate the Cost of Equity at different levels of debt:

Equity will become riskier -> Beta will increase -> Cost of Equity will increase.

Estimation will use levered beta calculation

2. Estimate the Cost of Debt at different levels of debt:

Default risk will go up and bond ratings will go down as debt goes up -> Cost of Debt will increase.

To estimating bond ratings, we will use the interest coverage ratio (EBIT/Interest expense)

3. Estimate the Cost of Capital at different levels of debt

4. Calculate the effect on Firm Value and Stock Price.

Disney's cost of capital schedule...

Debt Ratio	Beta	Cost of Equity	Cost of Debt (after-tax)	WACC
0%	0.9239	8.07%	2.01%	8.07%
10%	0.9895	8.45%	2.01%	7.81%

A Framework for Getting to the Optimal

Disney: Applying the Framework

Vale: Applying the Framework

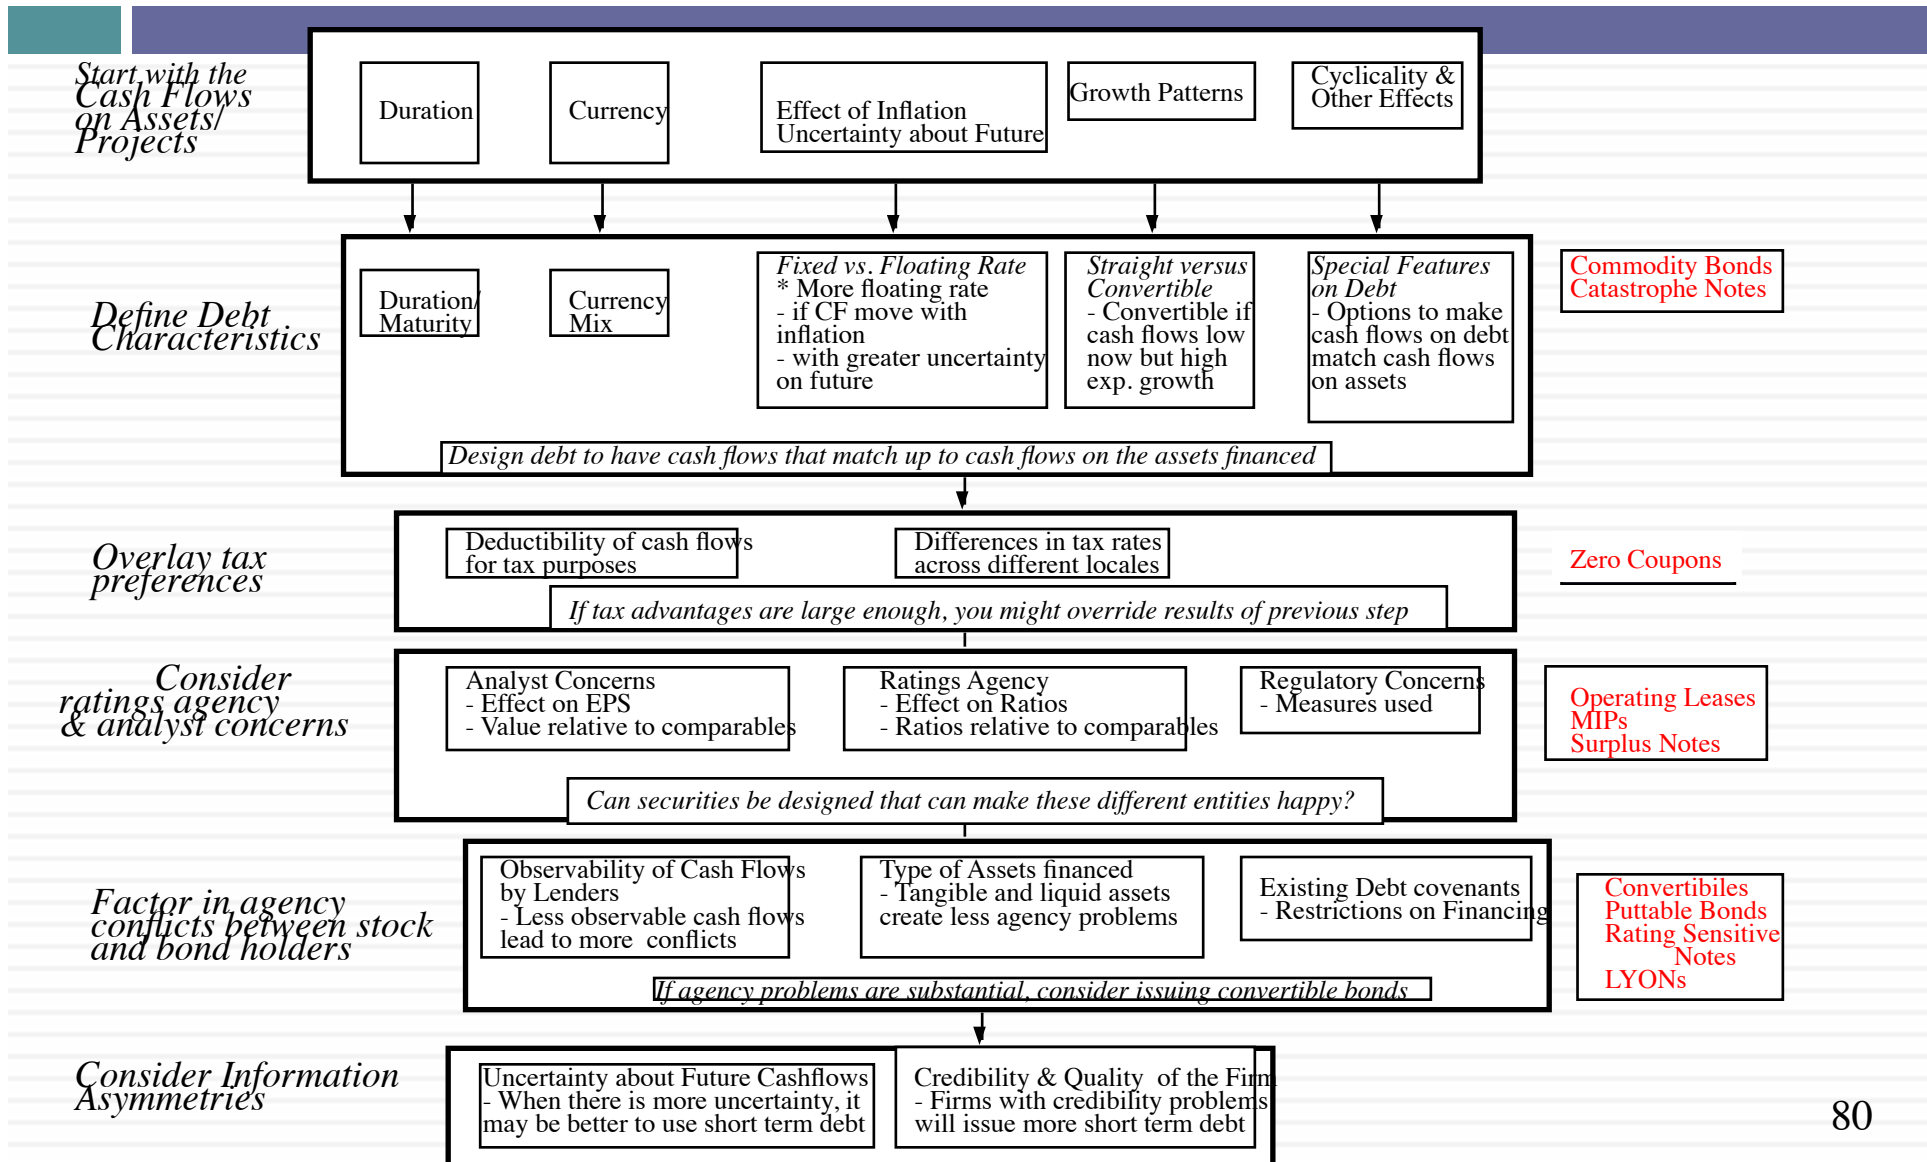

Designing Debt: The Fundamental Principle

- The objective in designing debt is to make the cash flows on debt match up as closely as possible with the cash flows that the firm makes on its assets.
- By doing so, we reduce our risk of default, increase debt capacity and increase firm value.

Designing Debt: Bringing it all together

I. Disney's perfect debt

81

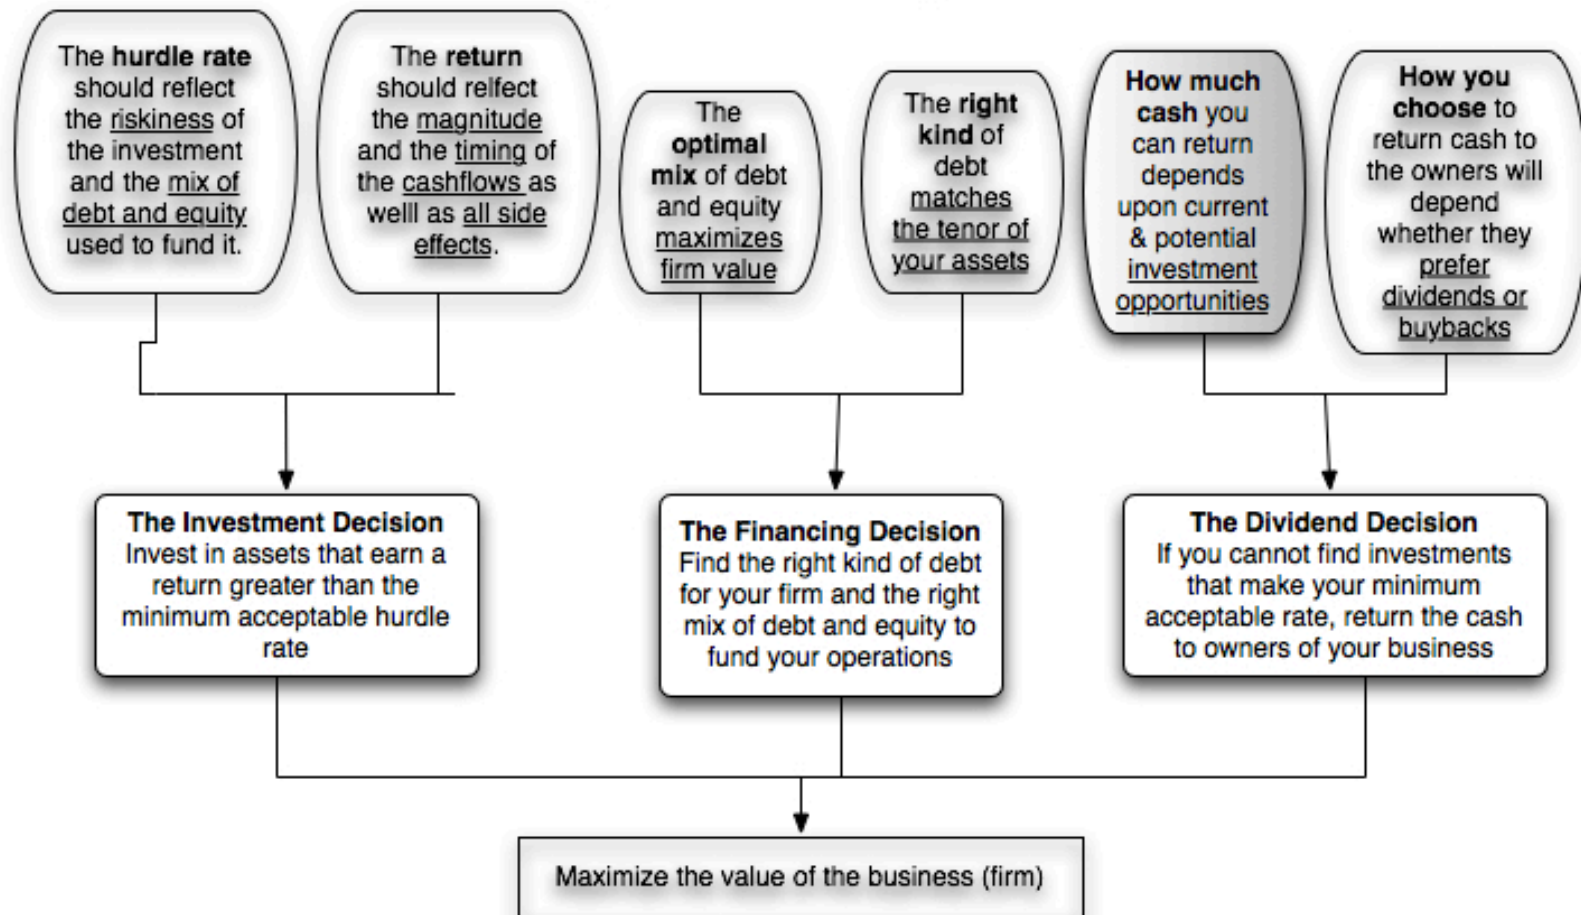

<i>Business</i>	<i>Project Cash Flow Characteristics</i>	<i>Type of Financing</i>
Studio entertainment	<p>Movie projects are likely to</p> <ul style="list-style-type: none"> • Be short-term • Have cash outflows primarily in dollars (because Disney makes most of its movies in the U.S.), but cash inflows could have a substantial foreign currency component (because of overseas revenues) • Have net cash flows that are heavily driven by whether the movie is a hit, which is often difficult to predict 	<p>Debt should be</p> <ol style="list-style-type: none"> 1. Short-term 2. Mixed currency debt, reflecting audience make-up. 3. If possible, tied to the success of movies.
Media networks	<p>Projects are likely to be</p> <ol style="list-style-type: none"> 1. Short-term 2. Primarily in dollars, though foreign component is growing, especially for ESPN. 3. Driven by advertising revenues and show success (Nielsen ratings) 	<p>Debt should be</p> <ol style="list-style-type: none"> 1. Short-term 2. Primarily dollar debt 3. If possible, linked to network ratings
Park resorts	<p>Projects are likely to be</p> <ol style="list-style-type: none"> 1. Very long-term 2. Currency will be a function of the region (rather than country) where park is located. 3. Affected by success of studio entertainment and media networks divisions 	<p>Debt should be</p> <ol style="list-style-type: none"> 1. Long-term 2. Mix of currencies, based on tourist makeup at the park.
Consumer products	<p>Projects are likely to be short- to medium-term and linked to the success of the movie division; most of Disney's product offerings and licensing revenues are derived from their movie productions</p>	<p>Debt should be</p> <ol style="list-style-type: none"> 1. Medium-term 2. Dollar debt
Interactive	<p>Projects are likely to be short-term, with high growth potential and significant risk. While cash flows will initially be primarily in US dollars, the mix of currencies will shift as the business ages.</p>	<p>Debt should be short-term, convertible US dollar debt.</p>

II. Vale's perfect debt

- Vale's mines are spread around the world, and it generates a large portion of its revenues in China (37%). Its mines typically have very long lives and require large up-front investments, and the costs are usually in the local currencies but its revenues are in US dollars.
- Recommendation: Long term, dollar-denominated debt (with hedging of local currency risk exposure) and if possible, tied to commodity prices.
- Actual: The existing debt at Vale is primarily US dollar debt (65.48%), with an average maturity of 14.70 years. All of the debt, as far as we can assess, is fixed rate and there is no commodity-linked debt.

First Principles

Chapter 10: Dividend Policy

Assessing Dividend Policy

- Step 1: How much could the company have paid out during the period under question?
- Step 2: How much did the the company actually pay out during the period in question?
- Step 3: How much do I trust the management of this company with excess cash?
 - How well did they make investments during the period in question?
 - How well has my stock performed during the period in question?

How much has the company returned to stockholders?

- As firms increasingly use stock buybacks, we have to measure cash returned to stockholders as not only dividends but also buybacks.
- Looking at Disney & Vale

Year	<i>Disney</i>		<i>Vale</i>	
	Dividends	Buybacks	Dividends	Buybacks
2008	\$648	\$648	\$2,993	\$741
2009	\$653	\$2,669	\$2,771	\$9
2010	\$756	\$4,993	\$3,037	\$1,930
2011	\$1,076	\$3,015	\$9,062	\$3,051
2012	\$1,324	\$4,087	\$6,006	\$0
2008-12	\$4,457	\$15,412	\$23,869	\$5,731

A Measure of How Much a Company Could have Afforded to Pay out: FCFE

- The Free Cashflow to Equity (FCFE) is a measure of how much cash is left in the business after non-equity claimholders (debt and preferred stock) have been paid, and after any reinvestment needed to sustain the firm's assets and future growth.

Net Income

+ Depreciation & Amortization

= Cash flows from Operations to Equity Investors

- Preferred Dividends

- Capital Expenditures

- Working Capital Needs

- Principal Repayments

+ Proceeds from New Debt Issues

= Free Cash flow to Equity

Disney's FCFE and Cash Returned: 2008 – 2012

	2012	2011	2010	2009	2008	Aggregate
Net Income	\$6,136	\$5,682	\$4,807	\$3,963	\$3,307	\$23,895
- (Cap. Exp - Depr)	\$604	\$1,797	\$1,718	\$397	\$122	\$4,638
- Δ Working Capital	(\$133)	\$940	\$950	\$308	(\$109)	\$1,956
Free CF to Equity (pre-debt)	\$5,665	\$2,945	\$2,139	\$3,258	\$3,294	\$17,301
+ Net Debt Issued	\$1,881	\$4,246	\$2,743	\$1,190	(\$235)	\$9,825
= Free CF to Equity (actual debt)	\$7,546	\$7,191	\$4,882	\$4,448	\$3,059	\$27,126
Free CF to Equity (target debt ratio)	\$5,720	\$3,262	\$2,448	\$3,340	\$3,296	\$18,065
Dividends	\$1,324	\$1,076	\$756	\$653	\$648	\$4,457
Dividends + Buybacks	\$5,411	\$4,091	\$5,749	\$3,322	\$1,296	\$19,869

Disney returned about \$1.5 billion more than the \$18.1 billion it had available as FCFE with a normalized debt ratio of 11.58% (its current debt ratio).

Vale – Dividends versus FCFE

	Aggregate	Average
Net Income	\$57,404	\$5,740
Dividends	\$36,766	\$3,677
Dividend Payout Ratio	\$1	\$1
Stock Buybacks	\$6,032	\$603
Dividends + Buybacks	\$42,798	\$4,280
Cash Payout Ratio	\$1	
Free CF to Equity (pre-debt)	(\$1,903)	(\$190)
Free CF to Equity (actual debt)	\$1,036	\$104
Free CF to Equity (target debt ratio)	\$19,138	\$1,914
Cash payout as % of pre-debt FCFE	FCFE negative	
Cash payout as % of actual FCFE	4131.08%	
Cash payout as % of target FCFE	223.63%	

A Practical Framework for Analyzing Dividend Policy

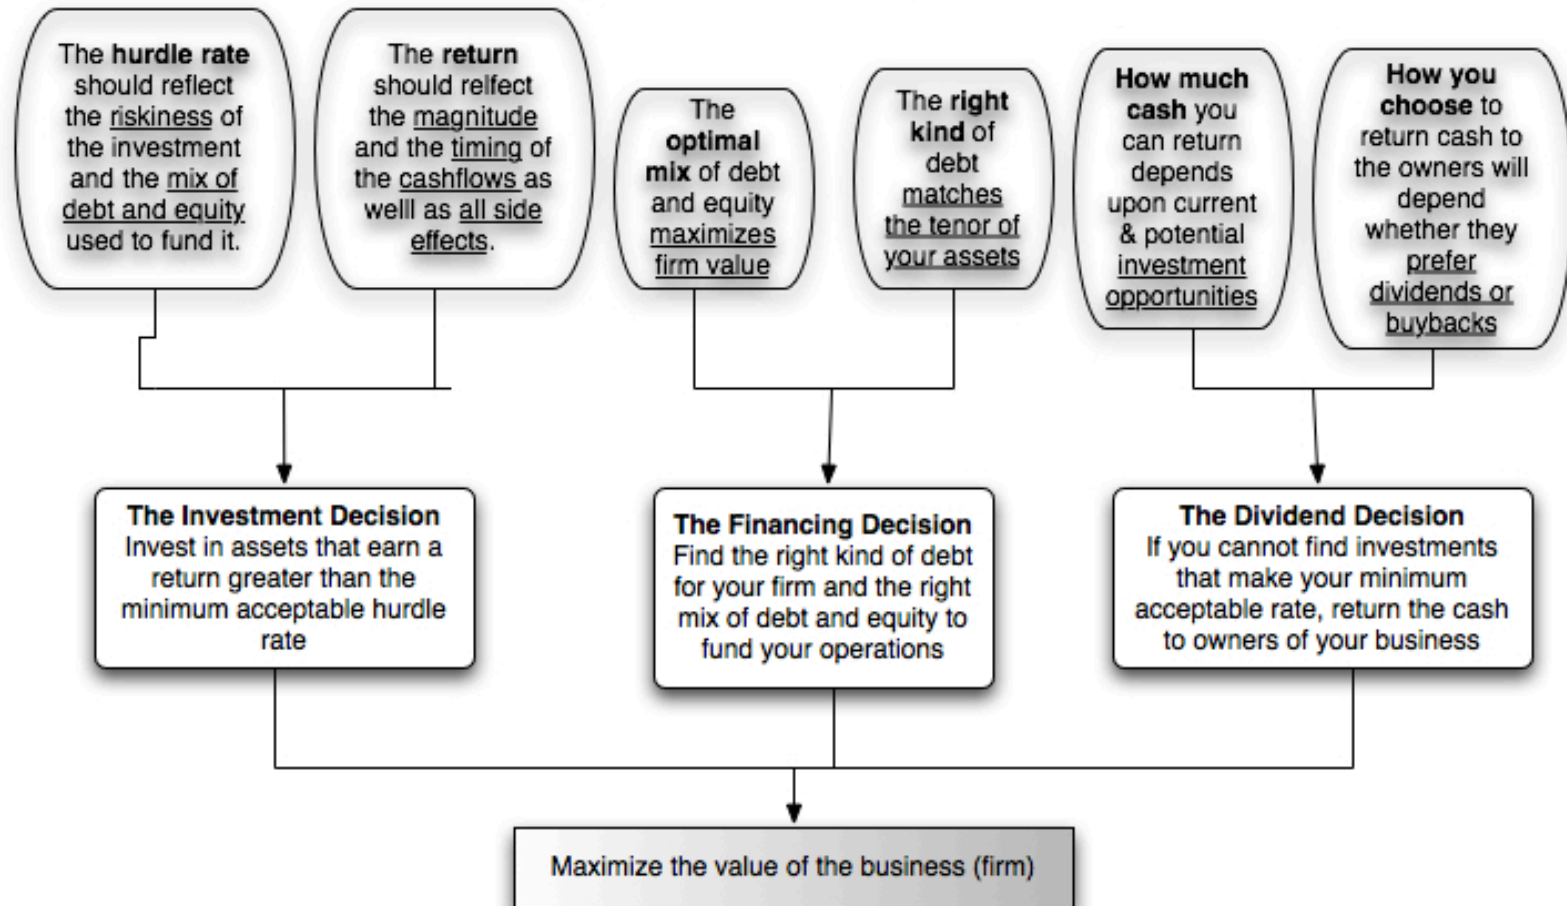

Can investors trust Vale's management?

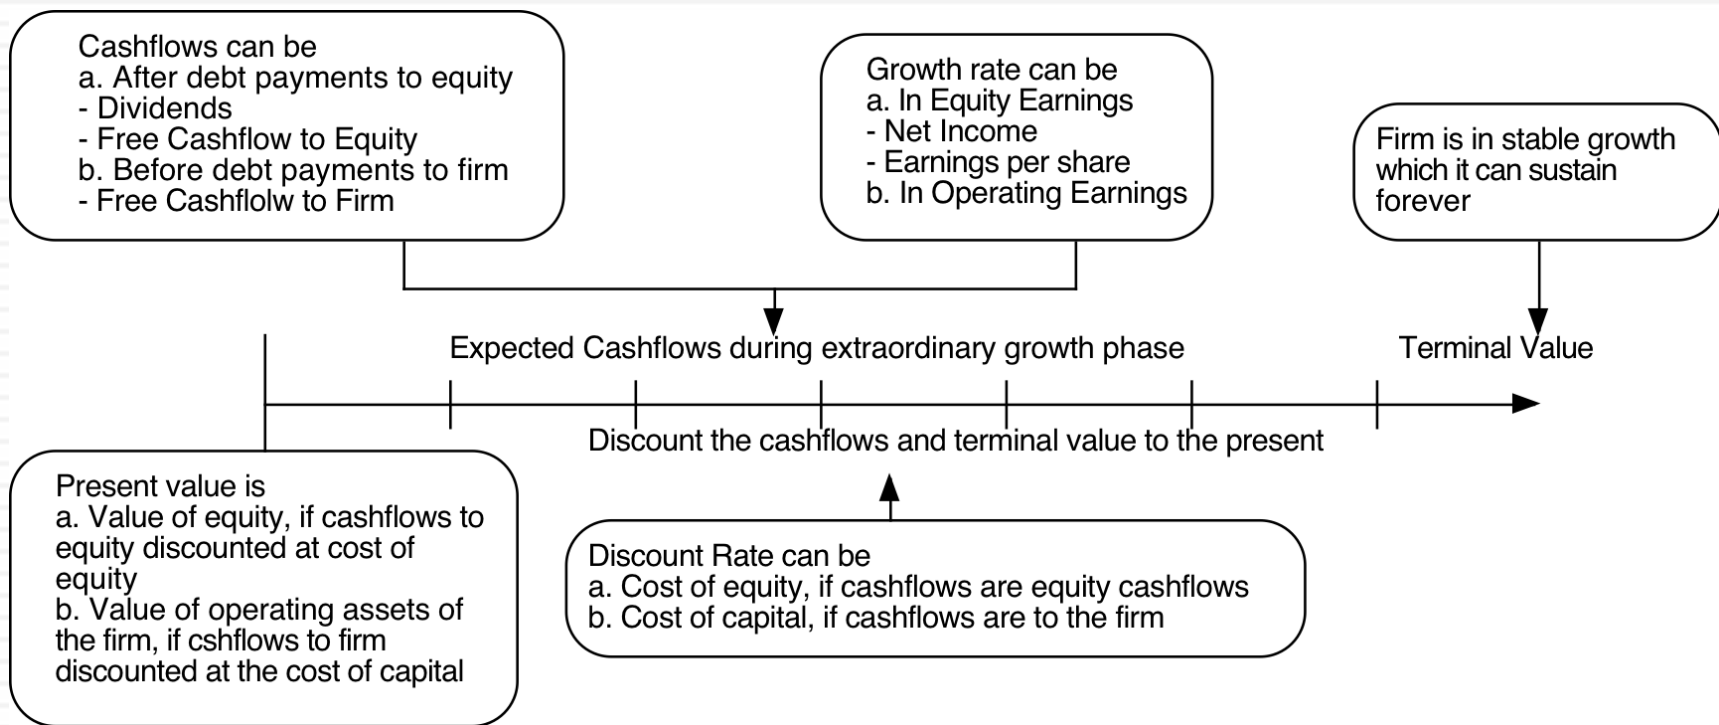

- Given Vale's track record, if you were a Vale common stockholder, would you be comfortable with Vale's dividend policy?
 - Yes
 - No
- How would your answer be different if you were a Vale preferred stockholder?

First Principles

Chapter 12: Value and Corporate Decisions

The Ingredients that determine value.

Disney - November 2013

Current Cashflow to Firm

Move to optimal debt ratio, with higher beta.

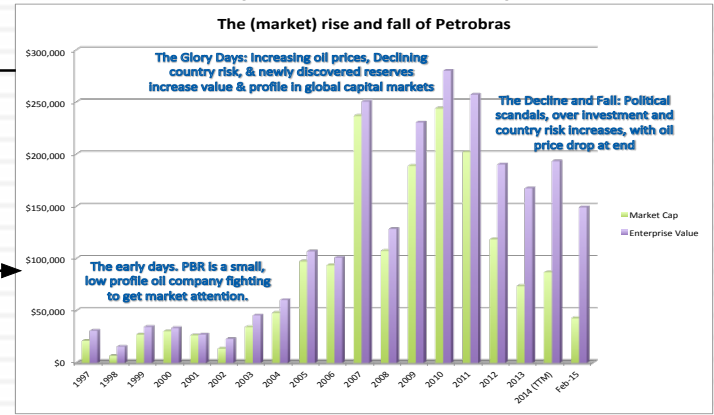

A Roadmap to destroying value: Petrobras (2015)

Step 1: Reinvest a lot, and reinvest badly..

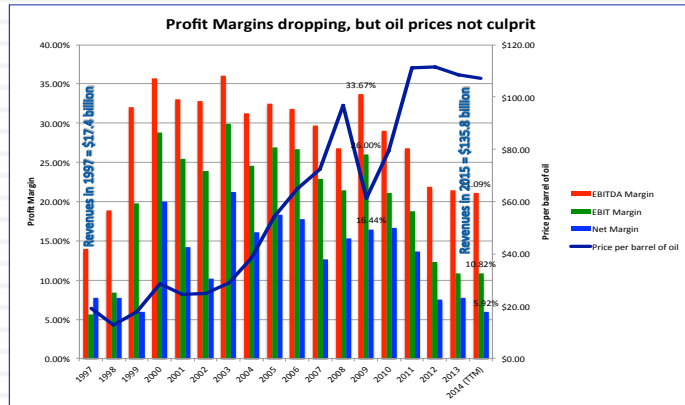

Rinse and Repeat

Step 5: Mission Accomplished

Step 2: Grow revenues, while letting profit margins slide

Step 4: Borrow money to cover the difference

Step 3: Pay dividends like a utility

Valuing Vale in April 2015 (in US dollars)

Let's start with some history & estimate what a normalized year will look like

Earning Surprise
Vale's last quarter earnings report came in well below expectations.

Year	Operating Income (\$)	Effective tax rate	BV of Debt	BV of Equity	Cash	Invested capital	ROIC
2010	\$23,033	18.67%	\$23,613	\$59,766	\$11,040	\$72,339	25.90%
2011	\$30,206	18.54%	\$27,668	\$70,076	\$9,913	\$87,831	28.01%
2012	\$13,434	18.96%	\$23,116	\$78,721	\$3,538	\$98,299	11.08%
2013	\$17,596	15.00%	\$30,196	\$75,974	\$5,818	\$100,352	14.90%
2014	\$8,497	20.00%	\$29,198	\$64,393	\$5,277	\$88,314	7.70%
Average	\$18,553	18.23%					17.52%

Petrobrased?
Vale could become the government's new focus, now that Petrobras is beyond repair.

Estimate the costs of equity & capital for Vale

Business	Unlevered beta	Proportion of value	D/E ratio	Levered beta
Metals & Mining	0.86	16.65%	90.63%	1.3744
Iron Ore	0.83	76.20%	90.63%	1.3264
Fertilizers	0.99	5.39%	90.63%	1.5821
Logistics	0.75	1.76%	90.63%	1.1986
Vale Operations	0.84	100%	90.63%	1.3424

Region	% of total	ERP
Brazil	68%	8.60%
Rest of the world	32%	7.18%
Vale		8.15%

Riskfree Rate	2.00%
Default Spread for Brazil	3.00%
Default spread for Vale	2.00%
Cost of debt for Vale (pre-tax)	7.00%

Brazil's rating & equity markets have held up, but its reputation and currency have suffered. ERP & Default Spreads (country & Vale) have widened.

$$\text{Cost of equity} = 2.00\% + 1.3424 (8.15\%) = 12.93\%$$

$$\text{Cost of capital} = 12.93\% (.5246) + 7.00\% (1-.34) (.4754) = 8.98\%$$

Assume that the company is in stable growth, growing 2% a year in perpetuity, with the last 12 months as the base year for operating income and assuming return on capital = cost of capital in perpetuity.

$$\text{Reinvestment Rate} = \frac{\text{Expected growth rate}}{\text{Return on Capital}} = \frac{2\%}{8.98\%} = 22.27\%$$

$$\text{Value of Operating Assets} = \frac{\$8,497 (1.02) (1-.1823)(1-.2227)}{(.0898 - .02)} = \$77,195$$

Value of operating assets	= \$ 77,195
+ Cash & Equity in Affiliates	= \$ 8,121
