## NARRATIVE AND NUMBERS: LIGHT IN THE DARKNESS!

When in trouble, go back to basics!

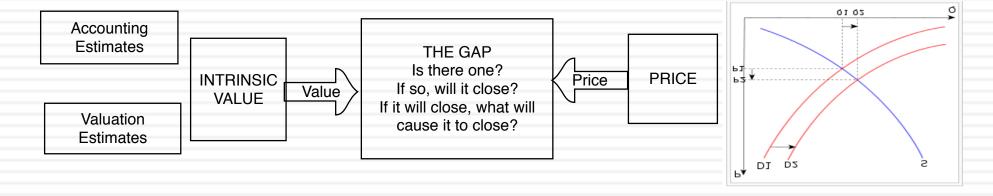

## Start with a reality check: Value ≠ Price

#### Drivers of intrinsic value

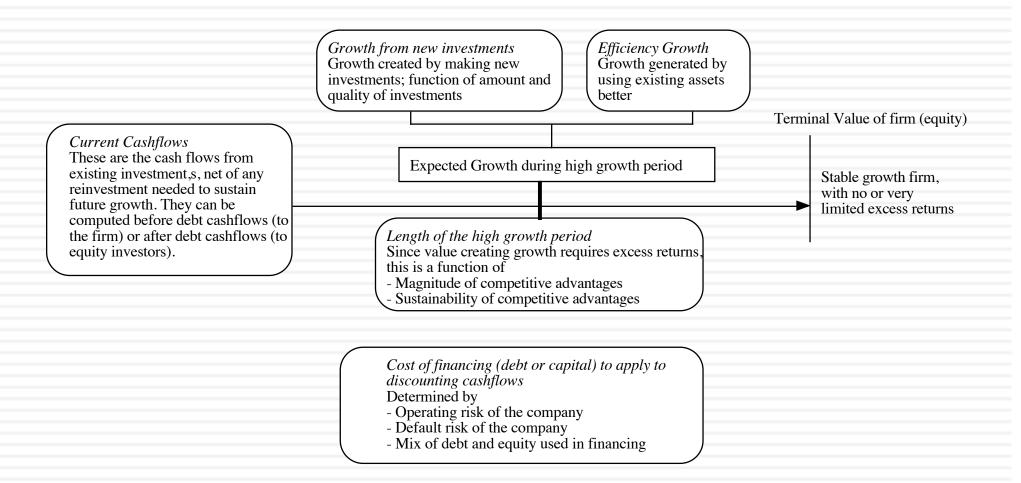

- Cashflows from existing assets
- Growth in cash flows
- Quality of Growth

#### Drivers of price

- Market moods & momentum
- Surface stories about fundamentals

### The Drivers of Value...

#### The two faces of discounted cash flow valuation

The value of a risky asset can be estimated by discounting the expected cash flows on the asset over its life at a risk-adjusted discount rate:

Value of asset = 
$$\frac{E(CF_1)}{(1+r)} + \frac{E(CF_2)}{(1+r)^2} + \frac{E(CF_3)}{(1+r)^3} + \dots + \frac{E(CF_n)}{(1+r)^n}$$

where the asset has an n-year life, E(CF<sub>t</sub>) is the expected cash flow in period t and r is a discount rate that reflects the risk of the cash flows.

 Alternatively, we can replace the expected cash flows with the guaranteed cash flows we would have accepted as an alternative (certainty equivalents) and discount these at the riskfree rate:

Value of asset = 
$$\frac{\text{CE}(\text{CF}_1)}{(1+r_f)} + \frac{\text{CE}(\text{CF}_2)}{(1+r_f)^2} + \frac{\text{CE}(\text{CF}_3)}{(1+r_f)^3} + \dots + \frac{\text{CE}(\text{CF}_n)}{(1+r_f)^n}$$

where CE(CFt) is the certainty equivalent of E(CF<sub>t</sub>) and  $r_f$  is the riskfree rate.

# DCF Choices: Equity Valuation versus Firm Valuation

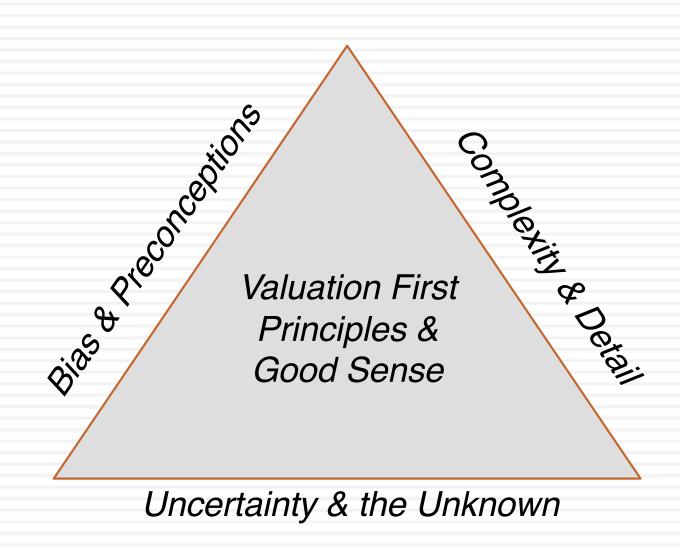

Firm Valuation: Value the entire business

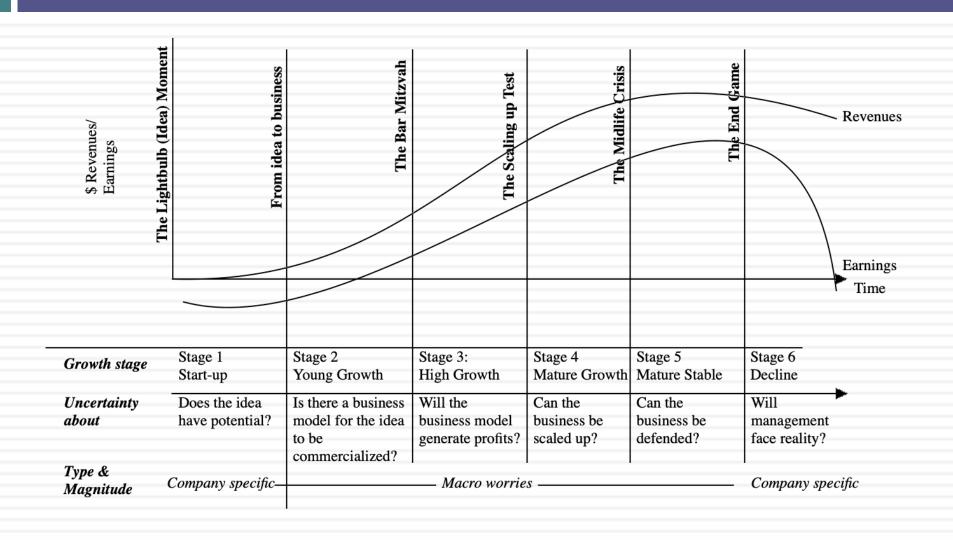

equity claim in the business

Aswath Damodaran

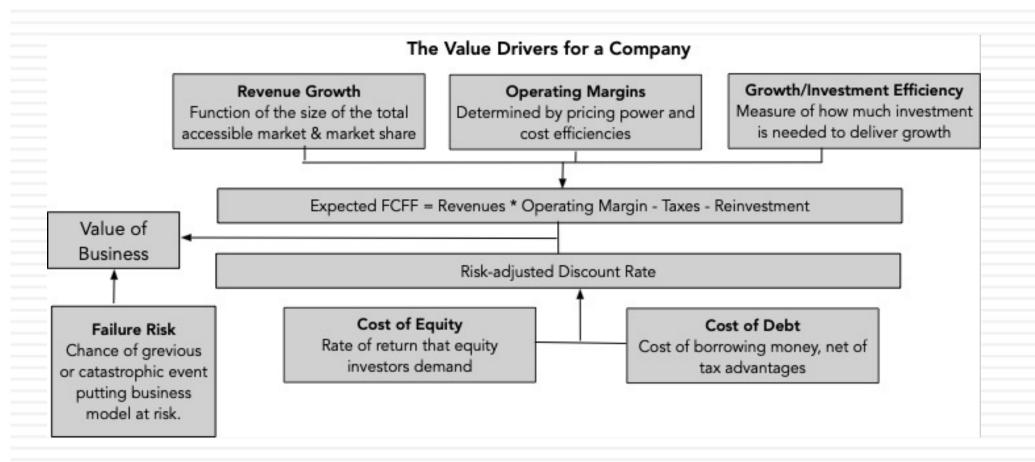

## The Bermuda Triangle of Valuation

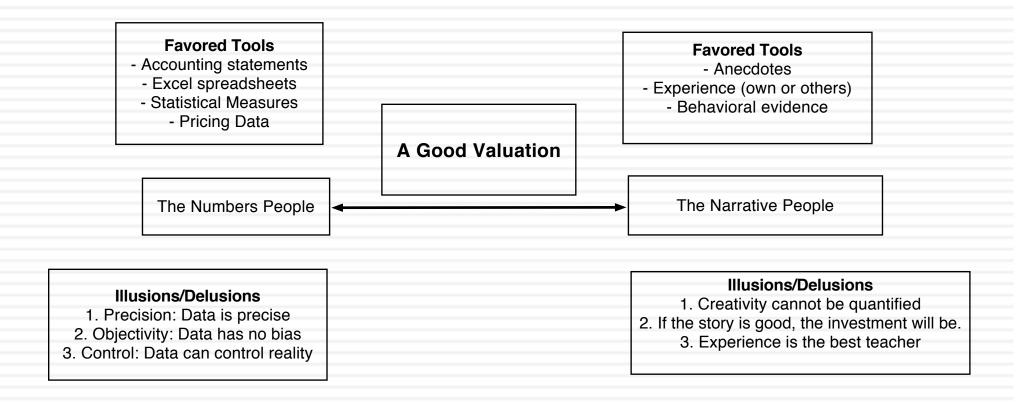

## A Life Cycle View of Uncertainty

#### Value: The Drivers

## Healthy Valuation = Story + Numbers

### The steps in valuation

#### Step 1: Develop a narrative for the business that you are valuing

In the narrative, you tell your story about how you see the business evolving over time.

#### Step 2: Test the narrative to see if it is possible, plausible and probable

There are lots of possible narratives, not all of them are plausible and only a few of them are probable.

#### Step 3: Convert the narrative into drivers of value

Take the narrative apart and look at how you will bring it into valuaton inputs starting with potential market size down to cash flows and risk. By the time you are done, each part of the narrative should have a place in your numbers and each number should be backed up by a portion of your story.

#### Step 4: Connect the drivers of value to a valuation

Create an intrinsic valuation model that connects the inputs to an end-value for the business.

#### Step 5: Keep the feedback loop open

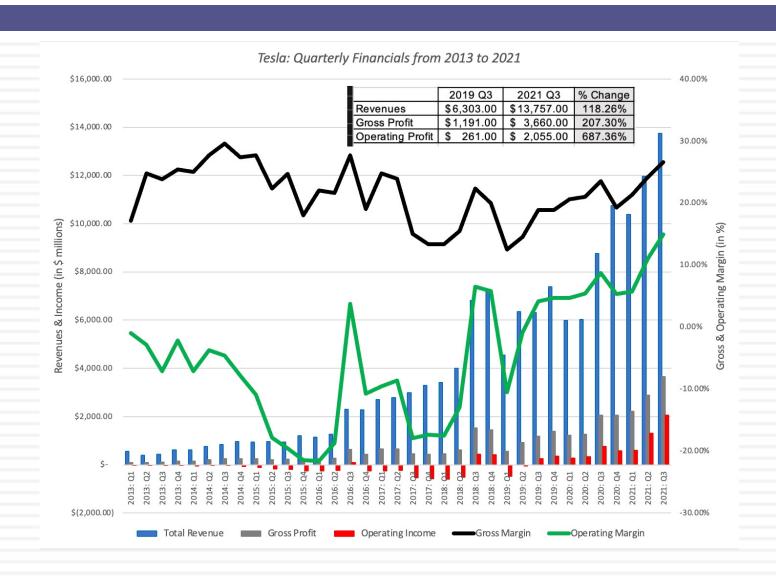

Listen to people who know the business better than you do and use their suggestions to fine tune your narrative and perhaps even alter it. Work out the effects on value of alternative narratives for the company.

#### Tesla in November 2021: The Base Numbers

Country of incorporation	United States		
Industry (US)	Auto & Truck		
Industry (Global)	Auto & Truck	Last 10K	Years since last 10K
Revenues	\$ 46,848.00	\$ 31,536.00	0.75

### The Value Drivers

The value drivers below:		
Compounded annual revenue growth rate over next 5 years =	35.00%	Growth Lever
Farget pre-tax operating margin (EBIT as % of sales in year 10)	16.00%	Profitability Lever
rear of convergence	5.00	Speed of convergence
	Years 1-5	Years 6-10
Sales to capital ratio (for computing reinvestment) =	4.00	2.67
Market numbers		
Riskfree rate	1.56%	
nitial cost of capital =	6.00%	

#### 1. Revenue Growth

Expected Revenues in 2030 (in \$ millions)	CAGR (next 5 years) More
A1: \$100 billion (BMW-like)	12.00%
A2: \$150 billion (Ford & Honda-like)	18.00%
A3: \$200 billion (Daimler-like)	22.50%
A4: \$300 billion (Toyota & VW -like)	30.00%
A5: \$500 billion (20% auto market share)	40.00%
A6: Direct Input (Enter % growth rate)	35.00%

#### Propositions about revenue growth

- 1. Percentage growth rates are deceptive. Always look at absolute revenue projections as well.
- 2. Scaling up is hard to do. Most companies fail.
- 3. Using macro stories to justify high growth rates and revenues for companies can and often will lead to a big market delusion.

### 2. Target Margin

Target Operating Margin
-5.87%
3.01%
7.52%
10.25%
21.24%
19.87%
16.00%

#### **Propositions about profitability**

- 1. Growth and margins are tied together. Strategies that try for more of one will deliver less of the other.
- 2. Scaling up is not always the antidote for losing money. Your costs have to grow slower than revenues, and that is not guaranteed.

## 3. Investment Efficiency (Sales to Capital)

Sales to Invested Capital	Sales to Capital (1st 5 years)
C1: Auto Industry First Quartile	0.75
C2: Auto Industry Median	1.37
C3: Auto Industry Third Quartile	2.42
C4: Technology Median	1.51
C5: Software	2.30
C6: FAANG Aggregate	1.27
C7: Direct Input	4.00

#### **Propositions about reinvestment**

- Reinvestment in valuation is a much broader concept than accounting net cap ex or working capital.
- 2. Tying revenue growth to reinvestment reinforces the trade off on growth, and helps determine whether growth will add or destroy value.

## 4. Risk in Operations (Cost of Capital)

Cost of Capital	Initial cost of capital
D1: Automobile Median	5.24%
D2: Technology Median	7.16%
D3: All companies - First Quartile	4.57%
D4: All companies - Median	5.90%
D5: All companies - Third Quartile	7.01%
D6: Direct Input	6.00%

#### Propositions about cost of capital

- The cost of capital is not a theoretical construct that comes out of risk and return models, but a reflection of what investors are demanding in the market place.
- 2. The discount rate is not on the top five or even top ten list of critical inputs driving value.

## Dealing with Options

Do you have employee options outstanding?	Yes
Number of options outstanding =	101.62
Average strike price =	\$69.04
Average maturity =	5.80
Standard deviation on stock price =	30.00%

#### **Propositions about options**

- Options are not shares (you cannot count them as shares outstanding) and they are not "not shares" (you cannot ignore them).
- 2. They have value that exceeds their exercise value, since they command a time premium.

## Defaults.. And Changing them..

More than 80% of Tesla's value of equity comes from its terminal value. It is a feature, not a bug.

A DCF is a going concern value. If there is a high risk that a company will not make it, you have to explicitly bring it in here.

The option overhang effect on value

	ICSIA
The Payoff to Flexibilit	y - A Plausible Path to Auto Dominance

Nov-21

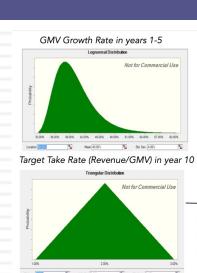

As the crisis handicaps its more indebted, slower moving competitors, Tesla will consolidate its hold on the electric car market and push its production towards 10 million cars by 2032, it will also be able to deliver higher margins than conventional auto companies in steady state, using revenues from other businesses to complement auto sales. The drop in risk free rates has reduced its cost of capital and the chance of failure. Tesla's more flexibile investment policies will allow it to be more efficient in generating growth. While other revenue sources (green energy, driverless cars in ride sharing) will supplement revenues, it will remain at its core an electric car company.

electric car company.
