DANTE MEETS DCF: VALUATION SINS AND REDEMPTION

Back to the very beginning: Approaches to Valuation

- Discounted Cashflow Valuation, where we try (sometimes desperately) to estimate the intrinsic value of an asset by using a mix of theory, guesswork and prayer.
- Relative valuation, where we pick a group of assets, attach the name "comparable" to them and tell a story.
- Contingent claim valuation, where we take the valuation that we did in the DCF valuation and divvy it up between the potential thieves (equity) and the victims of this crime (lenders)

Dante meets DCF: Nine layers of valuation hell.. And a bonus layer..

Layer 1: Base Year fixation....

The Wasserstein-Perella bonus layer
From aggregate to per share value?
No garnishing allowed!!
Debt ratios change, don't they?
The terminal value: It's not an ATM
Are you paying for growth?
What's in your discount rate?

High growth for how long?

Death and taxes

□ You are valuing Exxon Mobil, using the financial state ents of the firm from 2008. The following provides the key numbers:

Revenues \$477 billion

EBIT (1-t) \$ 58 billion

Net Cap Ex \$ 3 billion

Chg WC \$ 1 billion

FCFF \$ 54 billion

- The cost of capital for the firm is 8% and you use a very conservative stable growth rate of 2% to value the firm. The market cap for the firm is \$373 billion and it has \$ 10 billion in debt outstanding.
 - a. How under or over valued is the equity in the firm?
 - b. Would you buy the stock based on this valuation? Why or why not?

Layer 2: Taxes and Value

The Wasserstein-Perella bonus layer
From aggregate to per share value?

No garnishing allowed!!

Debt ratios change, don't they?

The terminal value: It's not an ATM

Are you paying for growth?

What's in your discount rate?

High growth for how long?

Death and taxes

Base year and accounting fixiation

nost

- Assume that you have been asked to value a company and have been provided with the recent year's financial statements:
- □ EBITDA 140
- □ DA 40
- □ EBIT 100 Free Cash flow to firm
- Taxable income 80 -(Cap Ex Depreciation)
- Taxes Change in non-cash WC
- □ Net Income 48 =FCFF
- Assume also that cash flows will be constant and that there is no growth in perpetuity. What is the free cash flow to the firm?
 - a. 88 million (Net income + Depreciation)
 - b. 108 million (EBIT taxes + Depreciation)
 - c. 100 million (EBIT (1-tax rate)+ Depreciation)
 - d. 60 million (EBIT (1- tax rate))
 - e. 48 million (Net Income)
 - f. 68 million (EBIT Taxes)

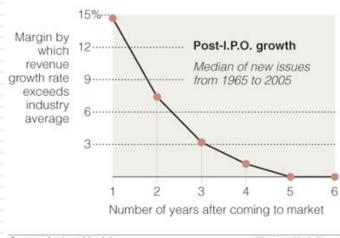

Layer 3: High Growth for how long...

The Wasserstein-Perella bonus layer
From aggregate to per share value?
No garnishing allowed!!
Debt ratios change, don't they?
The terminal value: It's not an ATM
Are you paying for growth?
What's in your disocunt rate?
High growth for how long?

□ Assume that you are valuing a young, high growth firm with great potential, just after its initial public offering. How long would you set your high growth period?

- \Box < 5 years
- □ 5 years
- □ 10 years
- □ >10 years

Typically, the revenue growth rate of a newly public company outpaces its industry average for only about five years.

The New York Times

Layer 4: The Cost of Capital

The Wasserstein-Perella bonus laye No garnishing allowed!! The terminal value: It's not an ATM Are you paying for growth? High growth for how long?

 The cost of capital for Chippewa Technologies, a US technology firm with 20% of its revenues from Brazil, has been computed using the following inputs:

Cost of equity = Riskfree Rate + Beta (ERP) + Small firm premium = 14% (5%)= 5% +1.20+ 3% Replaced current "Adjusted" Both from Ibbotson data base, derived Beta from T.Bond rate of 3% from 1926-2008 data ERP: Stocks - T.Bonds (Arithmetic with normalized Bloomberg rate of 5% average) Small firm: Smal stocks - Overall market = Cost of equity (Equity/ (Debt + Equity)) + Cost of debt (1- tax rate) (Debt/ (Debt + Equity)

Cost of capital

= 14%

Used market value of From above equity

(1000/2000)

Company is not rated and has no bonds. Used book interest rate = Int exp/ BV of debt

3%

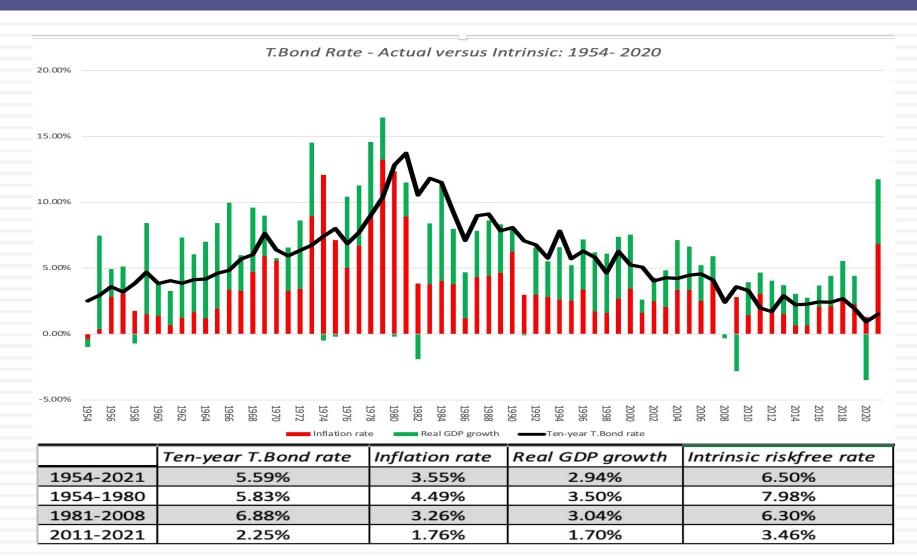

Used effective tax rate of 30%

(1-.30)

To be conservative. counted all liabilities. other than equity, as debt and used book value.

(1000/2000) = 8.05%

Some perspective on risk free rates

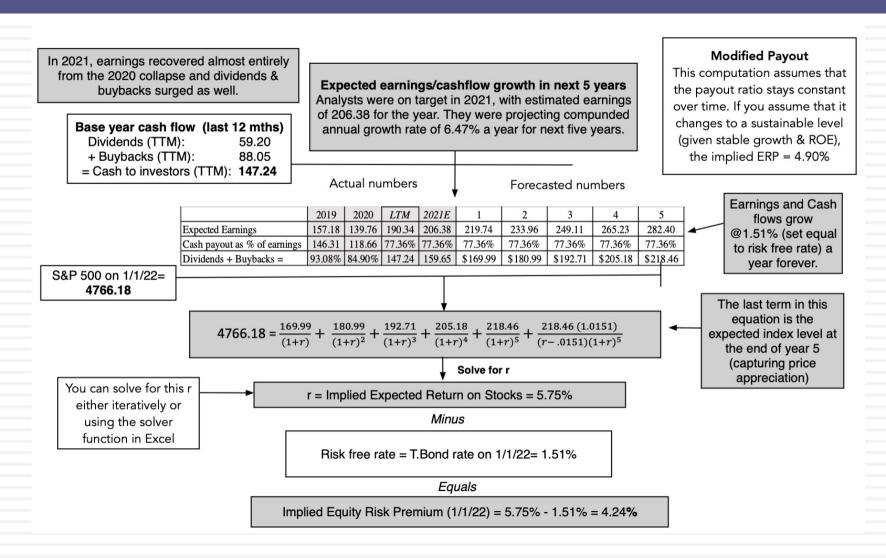

The Equity Risk Premium: The ubiquitous historical risk premium

- The historical premium is the premium that stocks have historically earned over riskless securities.
- While the users of historical risk premiums act as if it is a fact (rather than an estimate), it is sensitive to
 - How far back you go in history...
 - Whether you use T.bill rates or T.Bond rates
 - Whether you use geometric or arithmetic averages.
- For instance, looking at the US:

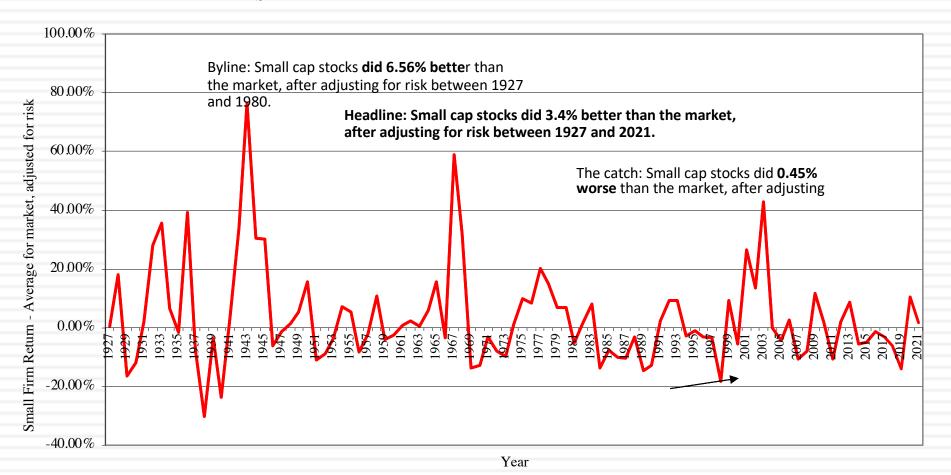

| | Arithme | tic Average | Geometric Average | | | |
|-----------|-------------------|-------------------|-------------------|-------------------|--|--|
| | Stocks - T. Bills | Stocks - T. Bonds | Stocks - T. Bills | Stocks - T. Bonds | | |
| 1928-2021 | 8.49% | 6.71% | 6.69% | 5.13% | | |
| Std Error | 2.05% | 2.17% | | | | |
| 1972-2021 | 8.04% | 5.47% | 6.70% | 4.47% | | |
| Std Error | 2.44% | 2.76% | | | | |
| 2012-2021 | 16.47% | 14.39% | 15.89% | 14.00% | | |
| Std Error | 3.88% | 4.59% | | | | |

An Alternative Approach

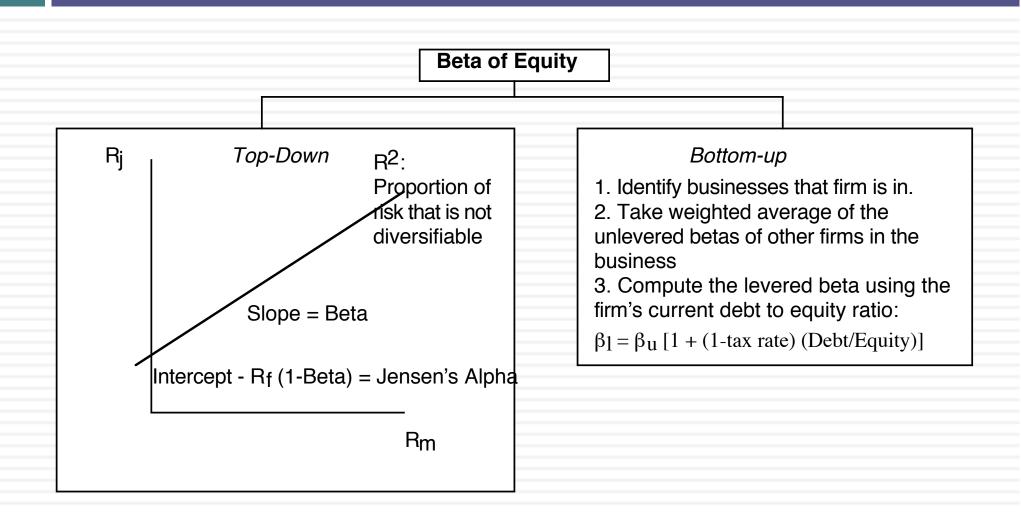

What small cap premium?

Small Firm Premium over time- 1927 -2021

Beta: Regression vs Bottom Up

The Correct Cost of Capital for Chippewa

| Input | What was used | What should have been used |
|----------------------------|-----------------------------------|--|
| Riskfree Rate | Corrected treasury bond rate = 5% | Actual treasury bond rate = 3% |
| Beta | Bloomberg adjusted beta = 1.20 | Sector average adjusted beta = 1.60 |
| | | (Based on small cap companies in sector) |
| Equity Risk Premium | Ibbotson premium =5% | Updated implied ERP = 6.5% |
| Other adjustments to | Small cap premium = 3% | No small cap premium |
| cost of equity | | Country risk adjustment = Lambda _{Brazil} * |
| | | Brazil CRP = 0.26*6.77% = 2.28% |
| Cost of equity | 5%+ 1.2 (5%) + 3% = 14% | 3% + 1.6 (6.5%) + 2.28% = 15.68% |
| Cost of debt (pre-tax) | 3% | 3%+6% (based on synthetic rating)=9% |
| Tax rate | Effective tax rate =30% | Marginal tax rate = 40% |
| Cost of debt (after- | 3% (13) = 2.1% | 9% (14) = 5.4% |
| tax) | | |
| Debt ratio | Book ratio: Liabilities=50% | Market ratio: Interest bearing debt = 30%; |
| | Equity=50% | Equity= 70% |
| Cost of capital | 14% (.5) + 2.1% (.5) = 8.05% | 15.68% (.7) + 5.4% (.3) = 12.60% |

Layer 5: The price of growth...

The Wasserstein-Perella bonus layer
From aggregate to per share value?

No garnishing allowed!!

Debt ratios change, don't they?

The terminal value: It's not an ATM

Are you paying for growth?

What's in your disocunt rate?

High growth for how long?

Base year and accouniting fixaiton

 You are looking at the projected cash flows provided by the management of the firm, for use in valuation

| Year | Current | 1 | 2 | 3 | 4 |
|----------------|----------|----------|----------|----------|----------|
| Growth rate | | 10% | 10% | 10% | 10% |
| Revenues | \$100.00 | \$110.00 | \$121.00 | \$133.10 | \$146.41 |
| EBIT (1-t) | \$30.00 | \$33.00 | \$36.30 | \$39.93 | \$43.92 |
| + Depreciation | \$15.00 | \$16.50 | \$18.15 | \$19.97 | \$21.96 |
| - Cap Ex | \$18.00 | \$19.80 | \$21.78 | \$23.96 | \$26.35 |
| - Chg in WC | \$3.00 | \$3.30 | \$3.63 | \$3.99 | \$4.39 |
| FCFF | \$24.00 | \$26.40 | \$29.04 | \$31.94 | \$35.14 |

What questions would you raise about the forecasts?

- You have been asked to value Hormel Foods, a firm which currently has the following cost of capital:
 - \square Cost of capital = 7.31% (.9) + 2.36% (.1) = 6.8%
- You believe that the target debt ratio for this firm should be 30%. What will the cost of capital be at the target debt ratio?

Which debt ratio (and cost of capital) should you use in valuing this company?

Layer 7: The Terminal Value

The Wasserstein-Perella bonus layer
From aggregate to per share value?
No garnishing allowed!!
The terminal value: It's not an ATM
Debt ratios change, don't they?
Are you paying for growth?
What's in your discount rate?
High growth for how long?
Death and taxes

- The best way to compute terminal value is to
- Use a stable growth model and assume cash flows grow at a fixed rate forever
- b. Use a multiple of EBITDA or revenues in the terminal year
- c. Use the estimated liquidation value of the assets
- You have been asked to value a business. The business expects to \$ 120 million in after-tax earnings (and cash flow) next year and to continue generating these earnings in perpetuity. The firm is all equity funded and the cost of equity is 10%; the riskfree rate is 3% and the ERP is 7%. What is the value of the business?
- Assume now that you were told that the firm can grow earnings at 2% a year forever. Estimate the value of the business.

Layer 8. From firm value to equity value: The Garnishing Effect...

- The Wasserstein-Perella bonus layer
 From aggregate to per share value?
 No garnishing allowed!!
 The terminal value: It's not an ATM
 Debt ratios change, don't they?

 Are you paying for growth?
 What's in your disocunt rate?
 High growth for how long?
- For a firm with consolidated financial statements, you have discounted free cashflows to the firm at the cost of capital to arrive at a firm value of \$ 100 million. The firm has
 - A cash balance of \$ 15 million
 - Debt outstanding of \$ 20 million
 - A 5% holding in another company: the book value of this holding is \$ 5 million. (Market value of equity in this company is \$ 200 million)
 - Minority interests of \$ 10 million on the balance sheet
- What is the value of equity in this firm?

How would your answer change if you knew that the firm was the target of a lawsuit it is likely to win but where the potential payout could be \$ 100 million if it loses?

Layer 9. From equity value to equity value p share

You have valued the equity in a firm at \$ 200 million. Estimate the value of equity per share if there are 10 million shares outstanding..

How would your answer change if you were told that there are 2 million employee options outstanding, with a strike price of \$ 20 a share and 5 years left to expiration?

Layer 10. The final circle of hell...

The Wasserstein-Perella bonus layer

From aggregate to per share value?

Dividends to Kennecott equal the difference between Carborandum's net profit (after adjustment) and the profit retention requirements needed to support Carborandum's growth. The utilization or \$40 million of tax loss carry-forwards and investment carreful carryforwards available to Kennecott are assumed to be utilized as a result of the Carborandum's growth. Carborandum is assumed to be sold at the end of ten years at a price equal to ten times earnings. The proceeds from this sale, \$1,162 million, are reduced by \$11.71 million as a result Sources: Exhibit 5 and casewriter projections.

| | Cost of Equity | Cost of Capital |
|---------------------------|----------------|-----------------|
| Kennecott Corp (Acquirer) | 13.0% | 10.5% |
| Carborandum (Target) | 16.5% | 12.5% |

Valuation is simple. We choose to make it complex!

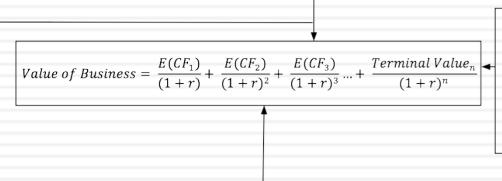

Value of growth

The future cash flows will reflect expectations of how quickly earnings will grow in the future (as a positive) and how much the company will have to reinvest to generate that growth (as a negative). The net effect will determine the value of growth. The expected cash flow is computed as net of taxes and reinvestment:

Expected Cash Flow = $E(CF_n)$ = Expected After-tax Operating Income in year n - Reinvestment in year n

Cash flows from existing assets

The base earnings will reflect the earnings power of the existing assets of the firm, net of taxes and any reinvestment needed to sustain the base earnings.

Terminal Value

This is the value that you attach to the business at the end of high growth. It can be a liquidation or going concern value.

Going Concern
$$Value_n = \frac{E(CF_{n+1})}{r-g}$$

Cost of Capital

The cost of capital can be affected by the tax code, if it tilts towards debt over equity or vice versa. In much of the world, debt creates a tax benefit, because interest is tax deductible and the tax savings are at the margin (at the marginal tax rate).

Risk adjusted Discount Rate = r = Cost of capital = Cost of Equity (Equity) + Cost of Debt (1-t) (Debt/(Debt+Equity)

Going Concern Va

But here's why valuation fails – The Bermuda Triangle of Valuation
