

Valuation: Solutions

Problem 1																			
a. False. The dividend discount model can still be used to value the dividends that the company will pay after the high growth eases.																			
b. False. It depends upon the assumptions made about expected future growth and risk.																			
c. False. This will be true only if the stock market falls more than merited by changes in the fundamentals (such as growth and cash flows).																			
d. True. Portfolios of stocks that are undervalued using the dividend discount model seem to earn excess returns over long time periods.																			
e. True. The model is biased towards these stocks because of its emphasis on dividends.																			
Problem 2																			
a. Cost of Equity = 6.25% + 0.90 * 5.5% = 11.20%																			
Value Per Share = \$3.56 * 1.055 / (.1120 - .055) = \$65.89																			
b. \$3.56 (1 + g) / (.1120 - g) = \$80																			
Solving for g,																			
g = (80 * .112 - 3.56) / (80 + 3.56) = 6.46%																			
Problem 3																			
a. There will be an increasing in the stable growth rate; the discount rate will also go up.																			
b. The stable growth rate will be higher, if the economy is growing faster.																			
c. The stable growth rate will not be affected, but the high growth period for this company will be longer.																			
d. Again the stable growth rate will be unaffected, but the high growth period and growth rate will be higher.																			
Problem 4																			
A. Expected Earnings Per Share in 1999 = \$2.10 * 1.155 * 1.06 = \$4.48																			
Expected Dividends Per Share in 1999 = \$4.48 * 0.65 = \$2.91																			
Cost Of Equity After 1999 = 6.25% + 1.1 * 5.5% = 12.30%																			
Expected Price at the End of 1998 = Expected DPS in 1999 / (ke, 1999 - g)																			
= \$2.91 / (.1230 - .06) = \$46.19																			
B.																			
Year	EPS	DPS																	
1994	\$2.42	\$0.79																	
1995	\$2.78	\$0.91																	
1996	\$3.19	\$1.05																	
1997	\$3.67	\$1.21																	
1998	\$4.22	\$1.39	\$46.19																
Cost of Equity = 6.25% + 1.40 * 5.5% = 13.95%																			
PV of Dividends and Terminal Price (@ 13.95%) = \$27.59																			
Problem 5																			
a. Retention Ratio = 1 - Payout Ratio = 1 - 0.42/1.50 = 72%																			
Return on Assets																			
= (Net Income + Int Exp (1-t)) / (BV of Debt + BV of Equity)																			
FALSE																			

Valuation: Solutions

Debt/Equity Ratio = $7.6/160 = .0475$									
Interest Rate on Debt = $0.8/7.6 = 10.53\%$									
Expected Growth Rate									
= $0.72 [.1819 + .0475 (.1819 - .1053 * (1 - 0.385))] = 13.5\%$									
Alternatively, and much more simply,									
Return on Equity = $30/160 = .1875$									
Expected Growth Rate = $0.72 * .1875 = 13.5\%$									
B. Expected payout ratio after 1998:									
= $1 - g/[ROA + D/E (ROA - i (1-t))]$									
= $1 - .06/ (.125 + .25 (.125 - .07(1-.385)))$									
58.76%									
c.	Beta in 1993 = 0.85								
	Unlevered Beta = $0.85/(1 + (1 - 0.385) * 0.05) = 0.8246$								
	Beta After 1998 = $0.8246 * (1 + (1 - 0.385) * 0.25) = 0.95$								
d.	Cost of Equity in 1999 = $7\% + 0.95 * 5.5\% = 12.23\%$								
	Expected Dividend in 1999								
	= $(\$1.50 * 1.1355 * 1.06) * 0.5876 = \1.76								
	Expected Price at End of 1998 = $\$1.76 / (.1223 - .06) = \28.25								
e.									
Year	EPS	DPS							
1994	\$1.70	\$0.48							
1995	\$1.93	\$0.54							
1996	\$2.19	\$0.61							
1997	\$2.49	\$0.70							
1998	\$2.83	\$0.79	\$28.25						
Cost of Equity = $7\% + 0.85 * 5.5\% =$			11.68%						
PV of Dividends and Terminal Price (@ 11.68%) =			\$18.47						
f.	Total Value per Share = \$18.47								
	Value Per Share Using Gordon Growth Model								
	= $\$1.50 * 1.06 * 0.5876 / (.1223 - .06) = \15.00								
	Value Per Share With No Growth = $\$1.50 * 0.5876 / .1223 = \7.21								
	Value of Extraordinary Growth = $\$18.47 - \$15.00 = \$3.47$								
	Value of Stable Growth = $\$15.00 - \$7.21 = \$7.79$								
Problem 6									
a.									
Period	EPS	DPS							
1	\$4.58	\$0.79							
2	\$5.32	\$0.92							
3	\$6.17	\$1.07							
4	\$7.15	\$1.21							

Valuation: Solutions

5	\$8.30	\$1.43								
6	\$9.46	\$2.35								
7	\$10.59	\$3.56								
8	\$11.65	\$4.94								
9	\$12.58	\$6.44								
10	\$13.34	\$8.00								
b.. Expected Price at End of 2003										
= $(\$13.34 * 1.06 * 0.60) / (.1175 - .06) = \147.54										
(Cost of Equity = 6.25% + 5.5% = 11.75%)										
c.										
PV of Dividends - High Growth = \$3.67										
PV of Dividends - Transition = \$9.10										
PV of Terminal Price = \$44.59										
Value Per Share = \$57.36										
Problem 7										
a. Value Per Share = $\$1.70 * 1.07 / (.1203 - .07) = \36.20										
(Cost of Equity = 6.25% + 1.05 * 5.50% = 12.03%)										
b.										
Current Earnings per share = \$3.20										
- (1 - Desired Debt Fraction) *										
(Capital Spending - Depreciation) = 83.61% * \$ 1.00 = \$0.84										
- (1 - Desired Debt Fraction) *										
Working Capital = 83.61% * \$0.00 = \$0.00										
Free Cash Flow to Equity = \$2.36										
Cost of Equity = 6.25% + 1.05 * 5.5% = 12.03%										
Value Per Share = $\$2.36 * 1.07 / (.1203 - .07) = \50.20										
This is based upon the assumption that the current ratio of capital expenditures to depreciation is maintained in perpetuity.										
c. The FCFE is greater than the dividends paid. The higher value from the model reflects the additional value from the cash accumulated in the firm.										
I would use the FCFE model, because it is a more realistic model.										
Problem 8										
a.										
Year	EPS	Cap Exp	Depr	WC	FCFE	Term Price				
1	\$2.71	\$2.60	\$1.30	\$0.05	\$1.64					
2	\$3.13	\$3.00	\$1.50	\$0.05	\$1.89

50%	\$10.88								
40%	\$13.14								
30%	\$15.40								
20%	\$17.66								
* This assumes that there is no change in expected growth, as a consequence.									
Problem 12									
A. Both models should have the same value, as long as a higher growth rate in earnings is used in the dividend discount model to reflect the growth created by the interest earned, and a lower beta to reflect the reduction in risk.									
B. The dividend discount model will overstate the true value, because it will not reflect the dilution that is inherent in the issue of new stock.									
C. Both models should provide the same value.									
D. Since acquisition, with the intent of diversifying, implies that the firm is paying too much (i.e., negative net present value), the dividend discount model will provide a lower value than the FCFE model.									
E. If the firm is over-levered to begin with, and borrows more money, there will be a loss of value from the over-leverage. The FCFE model will reflect this lost value, and will thus provide a lower estimate of value than the dividend discount model.									
Problem 13									
a. FCFF in 1993 = Net Income + Depreciation - Capital Expenditures - DWorking Capital + Interest Expenses (1 - tax rate)									
= \$770 + \$960 = \$734.80 million									
b. EBIT = Net Income/(1 - tax rate) + Interest Expenses									
= \$1523.125 million									
Return on Assets = EBIT (1-t)/ (BV of Debt + BV of Equity)									
10.83%									
Expected Growth Rate in FCFF = Retention Ratio * ROA									
6.50%									
Cost of Equity = 7% + 1.05 * 5.5% = 12.775%									
Cost of Capital = 8% (1 - 0.36) (4000/(4000 + 12000)) = 10.86%									
Value of the Firm = 734.80/ (.1086 - .065) = \$16,853 millions									
c. Value of Equity = Value of Firm - Market Value of Debt									
= \$16,853 - \$4,000 = \$12,853 millions									
Value Per Share = \$12,853/200 = \$64.27

a. Beta for the Health Division	= 1.15								
Cost of Equity	= $7\% + 1.15 * 5.5\% = 13.33\%$								
Cost of Capital	= $13.33\% * 0.80 + (7.5\% * 0.6) * 0.2 = 11.56\%$								
b.									
Year	Deprec'n	EBIT	EBIT(1-t)	Cap Ex	FCFF	Term Val			
0	\$350	\$560	\$336	\$420	\$266				
1	\$364	\$594	\$356	\$437	\$283				
2	\$379	\$629	\$378	\$454	\$302				
3	\$394	\$667	\$400	\$472	\$321				
4	\$409	\$707	\$424	\$491	\$342				
5	\$426	\$749	\$450	\$511	\$364	\$5,014			
			Now	After 5 years					
	Cost of Equity =		13.33%	13.33%					
	Cost of Debt =		4.50%	4.50%					
	Cost of Capital =		11.56%	11.56%					
Value of the Division	= $283/1.1156 + 302/1.1156^2 + 321/1.1156^3 + 342/1.1156^4 + (364 + 5014)/1.1156^5 = \$4,062 \text{ millions}$								
c. There might be potential for synergy	with an acquirer with related businesses.								
	The health division at Kodak might also be mismanaged, creating the potential for additional value from better management.								
Problem 16									

Valuation: Solutions

a.	Payout Ratio = $1.06/\$2.40 = 44.17\%$								
	Expected Growth Rate = 6%								
	Cost of Equity = $7\% + 1.05 * 5.5\% = 12.775\%$								
	P/E Ratio = $0.4417 * 1.06 / (.12775 - .06) = 6.91$								
b.	The stock is trading at ten times earnings.								
	P/E Ratio = $10 = 0.4417 (1+g) / (.12775-g)$								
Solving for g in this equation,									
	g	$= (1.2775 - 0.4417) / 10.4417 = 8\%$							
Problem 17									
a.	Average P/E Ratio for the Industry = 13.2								
	Median P/E Ratio for the Industry = 12.25								
If the firms in this group are homogeneous, the average P/E ratio provides an estimate of how much the market values earnings in this sector, given the expected growth potential and the risk in the sector.									
The average P/E ratio can be skewed by extreme values (since P/E cannot be less than zero). The median corrects for this by looking at the median firm in the sector.									
b. This statement is likely to be true only if									
(1) Thiokol has the same growth prospects and risk profile of the typical firm in the industry. It also generates cash flows for disbursement as dividends which are similar to the typical firm in the industry.									
(2) Thiokol has higher growth potential and/or lower risk than the typical firm in the industry.									
c. The regression of P/E ratios on fundamentals yields the following:									
P/E = $-2.33 + 35.74 \text{ Growth Rate} + 11.97 \text{ Beta} + 2.90 \text{ Payout Ratio}$									
R ² = 0.4068									
The following table provides predicted P/E ratios for the firms in the group:									
	Actual P/E	Predicted P/E	Difference						
Boeing	17.3	12.9	4.4						
General Dynam	15.5	17.9	-2.4						
GM- Hughes	16.5	13.68	2.82						
Grumman	11.4	12.07	-0.67						
Lockheed Corp	10.2	12.31	-2.11						
Logicon	12.4	13.17	-0.77						
Loral Corporati	13.3	13.21	0.09						
Martin Marietta	11	11.34	-0.34						
McDonnell Dou	22.6	17.15	5.45						
Northrop	9.5	14.82	-5.32						
Raytheon	12.1	10.85	1.25						
Rockwell	13.9	14.85	-0.95						
Thiokol	8.7	11.44	-2.74						
United Industri	10.4	9.11	1.29						
Again, negative numbers indicate that the stock is undervalued.									
The problem with a regression like this one is that it has relatively few observations and is likely to be thrown off by a few extreme observations.									

Valuation: Solutions

Problem 18							
a.	Dividend Payout Ratio = $\$2/\$4 = 50\%$						
	Return on Equity = $\$4/\$40 = 10\%$						
	Cost of Equity = $7\% + 0.85 * 5.5\% = 11.68\%$						
	Expected Growth Rate = 6%						
	Price/Book Value Ratio = $(.1) (.5)(1.06)/(.1168 - .06) = 0.93$						
b.	If the P/BV ratio is 1.5,						
	$1.5 = ROE (.5) (1.06)/(.1168 - .06),$						
	Solving for ROE = 16.08%						
Problem 19							
a.							
Company	Price	BV/ Share	P/BV	Beta	Exp. Growth	Payout	ROE
Air & Water	\$9.60	\$8.48	1.13	1.65	10.50%	0.00%	4.72%
Allwaste	\$5.40	\$3.10	1.74	1.1	18.50%	0.00%	8.06%
Browning Ferris	\$29.00	\$11.50	2.52	1.25	11.00%	46.90%	12.61%
Chemical Waste	\$9.40	\$3.75	2.51	1.15	2.50%	33.33%	12.00%
Groundwater	\$15.00	\$14.45	1.04	1	3.00%	0.00%	4.50%
Intern'l Tech.	\$3.30	\$3.35	0.99	1.1	11.00%	0.00%	4.78%
Ionics Inc.	\$48.00	\$31.00	1.55	1	14.50%	0.00%	7.10%
Laidlaw Inc.	\$6.30	\$5.85	1.08	1.15	8.50%	30.00%	6.84%
OHM Corp.	\$16.00	\$5.65	2.83	1.15	9.50%	0.00%	10.62%
Rollins	\$5.10	\$3.65	1.4	1.3	1.00%	0.00%	1.37%
Safety-Kleen	\$14.00	\$9.25	1.51	1.15	6.50%	45.00%	8.65%
Average			1.66	1.18	8.77%	14.11%	7.39%
Dividend Payout = DPS/EPS							
ROE = EPS/ BV of Equity							
The average price/book value ratio of these firms is 1.66, based on the following:							
(1) These firms have, on average, a lower growth rate than the firm being valued.							
(2) The firm being valued has more free cash flows available for paying dividends than the average firm in the sector.							
(3) The firm is unlevered. It should therefore have a lower beta.							
b. What subjective adjustments would you make to the price/book value ratio for this firm and why?							
On all three counts, a higher price/book value ratio should be used for this company.							
Problem 20							
a.	Dividend Payout Ratio = $\$1.12/\$2.45 = 0.4571$						
	Expected Growth Rate = 6%						
	Cost of Equity = $7\% + 0.9 (5.5\%) = 11.95\%$						
	Profit Margin = $2.45/122 = 2\%$						

Valuation: Solutions

	P/S Ratio = $.02 * 0.4571 * (1.06) / (.1195 - .06) = 0.16288$							
	Price Based on this Multiple = $0.16288 * 122 = \$19.87$							
b.	P/S Ratio Needed for a Price of \$34 = $\$34/122 = 0.2787$							
	Profit Margin Needed for this P/S Ratio = 0.0342 or 3.42%							
Problem 21								
	No. One would explain its high price to sales ratio by pointing to the combination of a high profit margin and a moderate growth rate.							
	P/S = $-0.79 + 11.50 \text{ Profit Margin} + 0.60 \text{ Payout} + 1.50 \text{ Growth} + 0.51 \text{ Beta}$							
	Walgreen's predicted P/S ratio would be -							
	P/S = $-0.79 + 11.50 (0.027) + 0.60 (.31) + 1.50 (.135) + 0.51 (1.15) = 0.4955$
