II. Project Specific Financing

- With project specific financing, you match the financing choices to the project being funded. The benefit is that the the debt is truly customized to the project.
- Project specific financing makes the most sense when you have a few large, independent projects to be financed. It becomes both impractical and costly when firms have portfolios of projects with interdependent cashflows.

Duration of Disney Theme Park

	Annual	Terminal	Present Value	Present
Year	Cashflow	Value	@8.46%	value *t
0	-\$2,000		-\$2,000	\$0
1	-\$1,000		-\$922	-\$922
2	-\$859		-\$730	-\$1,460
3	-\$267		-\$210	-\$629
4	\$340		\$246	\$983
5	\$466		\$311	\$1,553
6	\$516		\$317	\$1,903
7	\$555		\$314	\$2,200
8	\$615		\$321	\$2,568
9	\$681		\$328	\$2,952
10	\$715	\$11,275	\$5,321	\$53,206
			\$3,296	\$62,355
				18.91893724

Duration of the Project = 62,355/3296 = 18.92 years

The perfect theme park debt...

- The perfect debt for this theme park would have a duration of roughly 19 years and be in a mix of Latin American currencies (since it is located in Brazil), reflecting where the visitors to the park are coming from.
- If possible, you would tie the interest payments on the debt to the number of visitors at the park.

III. Firm-wide financing

 Rather than look at individual projects, you could consider the firm to be a portfolio of projects. The firm's past history should then provide clues as to what type of debt makes the most sense.

Operating Cash Flows

- The question of how sensitive a firm's asset cash flows are to a variety of factors, such as interest rates, inflation, currency rates and the economy, can be directly tested by regressing changes in the operating income against changes in these variables.
- This analysis is useful in determining the coupon/interest payment structure of the debt.

Firm Value

- The firm value is clearly a function of the level of operating income, but it also incorporates other factors such as expected growth & cost of capital.
- The firm value analysis is useful in determining the overall structure of the debt, particularly maturity.

I. Sensitivity to Interest Rate Changes

- How sensitive is the firm's value and operating income to changes in the level of interest rates?
- The answer to this question is important because it
 - it provides a measure of the duration of the firm's projects
 - it provides insight into whether the firm should be using fixed or floating rate debt.

Firm Value versus Interest Rate Changes

 Regressing changes in firm value against changes in interest rates over this period yields the following regression –

```
Change in Firm Value = 0.1790 - 2.3251 (Change in Interest Rates) (2.74) (0.39)
```

- T statistics are in brackets.
- The coefficient on the regression (-2.33) measures how much the value of Disney as a firm changes for a unit change in interest rates.

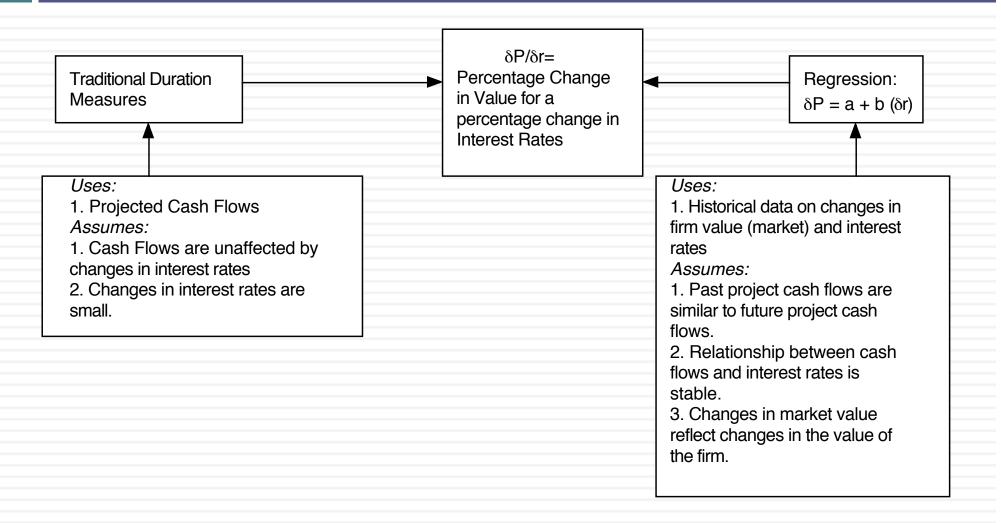

Why the coefficient on the regression is duration..

 The duration of a straight bond or loan issued by a company can be written in terms of the coupons (interest payments) on the bond (loan) and the face value of the bond to be –

Duration of Bond =
$$\frac{dP/P}{dr/r} = \frac{\left[\sum_{t=1}^{t=N} \frac{t*Coupon_t}{(1+r)^t} + \frac{N*Face Value}{(1+r)^N}\right]}{\left[\sum_{t=1}^{t=N} \frac{Coupon_t}{(1+r)^t} + \frac{Face Value}{(1+r)^N}\right]}$$

- The duration of a bond measures how much the price of the bond changes for a unit change in interest rates.
- Holding other factors constant, the duration of a bond will increase with the maturity of the bond, and decrease with the coupon rate on the bond.

Duration: Comparing Approaches

Operating Income versus Interest Rates

 Regressing changes in operating cash flow against changes in interest rates over this period yields the following regression –

Change in Operating Income = 0.1698 - 7.9339 (Change in Interest Rates) (2.69^a) (1.40)

<u>Conclusion</u>: Disney's operating income has been affected a lot more than its firm value has by changes in interest rates.

II. Sensitivity to Changes in GDP/ GNP

- How sensitive is the firm's value and operating income to changes in the GNP/GDP?
- ☐ The answer to this question is important because
 - it provides insight into whether the firm's cash flows are cyclical and
 - whether the cash flows on the firm's debt should be designed to protect against cyclical factors.
- If the cash flows and firm value are sensitive to movements in the economy, the firm will either have to issue less debt overall, or add special features to the debt to tie cash flows on the debt to the firm's cash flows.

Regression Results

 Regressing changes in firm value against changes in the GDP over this period yields the following regression –

```
Change in Firm Value = 0.0067 + 6.7000 (GDP Growth) (0.06) (2.03^{\circ})
```

Conclusion: Disney is sensitive to economic growth

 Regressing changes in operating cash flow against changes in GDP over this period yields the following regression –

```
Change in Operating Income = 0.0142 + 6.6443 (GDP Growth) (0.13) (2.05<sup>a</sup>)
```

Conclusion: Disney's operating income is sensitive to economic growth as well.

III. Sensitivity to Currency Changes

- How sensitive is the firm's value and operating income to changes in exchange rates?
- □ The answer to this question is important, because
 - it provides a measure of how sensitive cash flows and firm value are to changes in the currency
 - it provides guidance on whether the firm should issue debt in another currency that it may be exposed to.
- If cash flows and firm value are sensitive to changes in the dollar, the firm should
 - figure out which currency its cash flows are in;
 - and issued some debt in that currency

Regression Results

 Regressing changes in firm value against changes in the dollar over this period yields the following regression –

Change in Firm Value = 0.1774- 0.5705 (Change in Dollar) (2.76) (0.67)

Conclusion: Disney's value is sensitive to exchange rate changes, decreasing as the dollar strengthens. However, the effect is statistically insignificant.

 Regressing changes in operating cash flow against changes in the dollar over this period yields the following regression –

Change in Operating Income = 0.1680 - 1.6773 (Change in Dollar) (2.82°) (2.13°)

<u>Conclusion</u>: Disney's operating income is more strongly impacted by the dollar than its value is. A stronger dollar seems to hurt operating income.

IV. Sensitivity to Inflation

- How sensitive is the firm's value and operating income to changes in the inflation rate?
- The answer to this question is important, because
 - it provides a measure of whether cash flows are positively or negatively impacted by inflation.
 - it then helps in the design of debt; whether the debt should be fixed or floating rate debt.
- If cash flows move with inflation, increasing (decreasing) as inflation increases (decreases), the debt should have a larger floating rate component.

Regression Results

 Regressing changes in firm value against changes in inflation over this period yields the following regression –

Change in Firm Value = 0.1855 + 2.9966 (Change in Inflation Rate) (2.96) (0.90)

<u>Conclusion</u>: Disney's firm value does seem to increase with inflation, but not by much (statistical significance is low)

 Regressing changes in operating cash flow against changes in inflation over this period yields the following regression –

Change in Operating Income = 0.1919 + 8.1867 (Change in Inflation Rate) (3.43^a) (2.76^a)

<u>Conclusion</u>: Disney's operating income increases in periods when inflation increases, suggesting that Disney does have pricing power.

Summarizing...

- Looking at the four macroeconomic regressions, we would conclude that
 - Disney's assets collectively have a duration of about 2.33 years
 - Disney is increasingly affected by economic cycles
 - Disney is hurt by a stronger dollar
 - Disney's operating income tends to move with inflation
- All of the regression coefficients have substantial standard errors associated with them. One way to reduce the error (a la bottom up betas) is to use sector-wide averages for each of the coefficients.

Bottom-up Estimates

These weights reflect the estimated values of the businesses

	Interest	GDP			
Business	rates	Growth	Inflation	Currency	Weights
Media Networks	-3.70	0.56	1.41	-1.23	49.27%
Parks & Resorts	-4.50	0.70	-3.05	-1.58	33.81%
Studio	-6.47	0.22	-1.45	-3.21	
Entertainment	-0.47	0.22	-1.43	-3.21	13.49%
Consumer Products	-4.88	0.13	-5.51	-3.01	2.18%
Interactive	-1.01	0.25	-3.55	-2.86	1.25%
Disney Operations	-4.34	0.55	-0.70	-1.67	100.00%

Recommendations for Disney

- The debt issued should be long term and should have duration of about 4.3 years.
- A significant portion of the debt should be floating rate debt, reflecting Disney's capacity to pass inflation through to its customers and the fact that operating income tends to increase as interest rates go up.
- Given Disney's sensitivity to a stronger dollar, a portion of the debt should be in foreign currencies. The specific currency used and the magnitude of the foreign currency debt should reflect where Disney makes its revenues. Based upon 2013 numbers at least, this would indicate that about 18% of its debt should be in foreign currencies (and perhaps more, since even their US dollar income can be affected by currency movements).

Analyzing Disney's Current Debt

- Disney has \$14.3 billion in interest-bearing debt with a face-value weighted average maturity of 7.92 years. Allowing for the fact that the maturity of debt is higher than the duration, this would indicate that Disney's debt may be a little longer than would be optimal, but not by much.
- Of the debt, about 5.49% of the debt is in non-US dollar currencies (Indian rupees and Hong Kong dollars), but the rest is in US dollars and the company has no Euro debt. Based on our analysis, we would suggest that Disney increase its proportion of Euro debt to about 12% and tie the choice of currency on future debt issues to its expansion plans.
- Disney has no convertible debt and about 5.67% of its debt is floating rate debt, which looks low, given the company's pricing power. While the mix of debt in 2013 may be reflective of a desire to lock in low long-term interest rates on debt, as rates rise, the company should consider expanding its use of foreign currency debt.

Adjusting Debt at Disney

- It can swap some of its existing fixed rate, dollar debt for floating rate, foreign currency debt. Given Disney's standing in financial markets and its large market capitalization, this should not be difficult to do.
- If Disney is planning new debt issues, either to get to a higher debt ratio or to fund new investments, it can use primarily floating rate, foreign currency debt to fund these new investments. Although it may be mismatching the funding on these investments, its debt matching will become better at the company level.

Debt Design for Bookscape & Vale

- Bookscape: Given Bookscape's dependence on revenues at its New York bookstore, we would design the debt to be
 - Recommendation: Long-term, dollar denominated, fixed rate debt
 - Actual: Long term operating lease on the store
- Vale: Vale's mines are spread around the world, and it generates a large portion of its revenues in China (37%). Its mines typically have very long lives and require large up-front investments, and the costs are usually in the local currencies but its revenues are in US dollars.
 - Recommendation: Long term, dollar-denominated debt (with hedging of local currency risk exposure) and if possible, tied to commodity prices.
 - <u>Actual</u>: The existing debt at Vale is primarily US dollar debt (65.48%), with an average maturity of 14.70 years. All of the debt, as far as we can assess, is fixed rate and there is no commodity-linked debt.

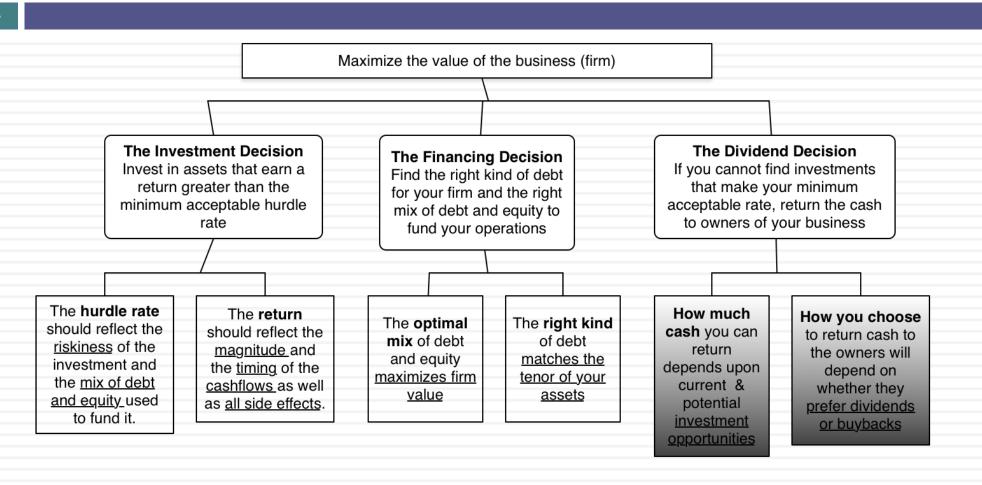

And for Tata Motors and Baidu

- Tata Motors: As an manufacturing firm, with big chunks of its of its revenues coming from India and China (about 24% apiece) and the rest spread across developed markets.
 - Recommendation: Medium to long term, fixed rate debt in a mix of currencies reflecting operations.
 - <u>Actual</u>: The existing debt at Tata Motors is a mix of Indian rupee debt (about 71%) and Euro debt (about 29%), with an average maturity of 5.33 years and it is almost entirely fixed rate debt.
- Baidu: Baidu has relatively little debt at the moment, reflecting its status as a young, technology company.
 - Recommendation: Convertible, Chinese Yuan debt.
 - Actual: About 82% of Baidu's debt is in US dollars and Euros currently, with an average maturity of 5.80 years. A small portion is floating rate debt, but very little of the debt is convertible.

RETURNING CASH TO THE OWNERS: DIVIDEND POLICY

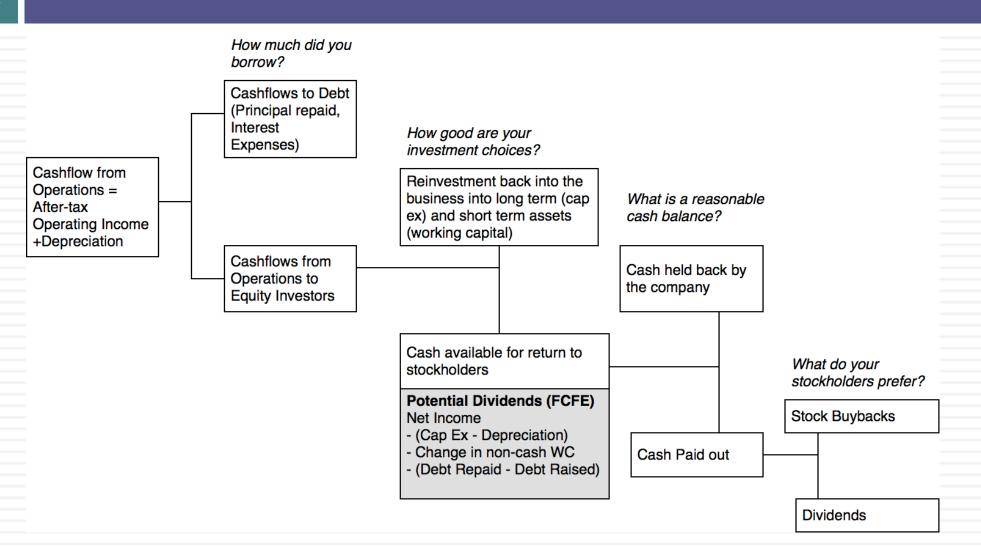

"Companies don't have cash. They hold cash for their stockholders."

First Principles

Steps to the Dividend Decision... if equity is treated as a residual claim

145

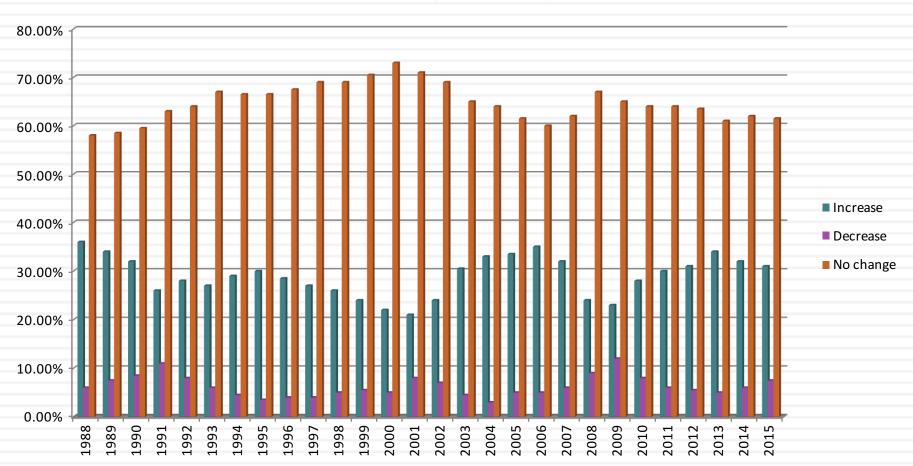

The Roots of Dividend Dysfunction

- In practice, dividend policy is dysfunctional and does not follow the logical process of starting with your investment opportunities and working your way down to residual cash.
- The two dominant factors driving dividend policy around the world are:
 - Inertia: Companies seem to hate to let of their past, when it comes to dividend policy.
 - Me-too-ism: Companies want to behave like their peer group.

I. Dividends are sticky

Dividend Changes at US companies

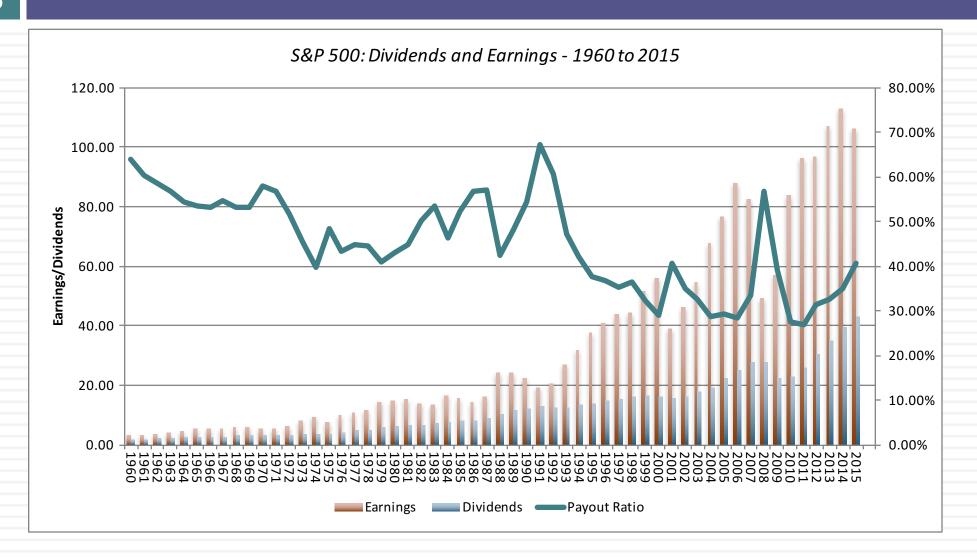

Aswath Damodaran

The last quarter of 2008 put stickiness to the test.. Number of S&P 500 companies that...

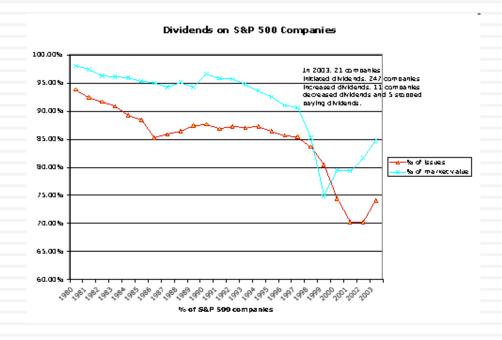

Quarter	Dividend Increase	Dividend initiated	Dividend decrease	Dividend suspensions
Q1 2007	102	1	1	1
Q2 2007	63	1	1	5
Q3 2007	59	2	2	0
Q4 2007	63	7	4	2
Q1 2008	93	3	7	4
Q2 2008	65	0	9	0
Q3 2008	45	2	6	8
Q4 2008	32	0	17	10

II. Dividends tend to follow earnings

III. Are affected by tax laws...

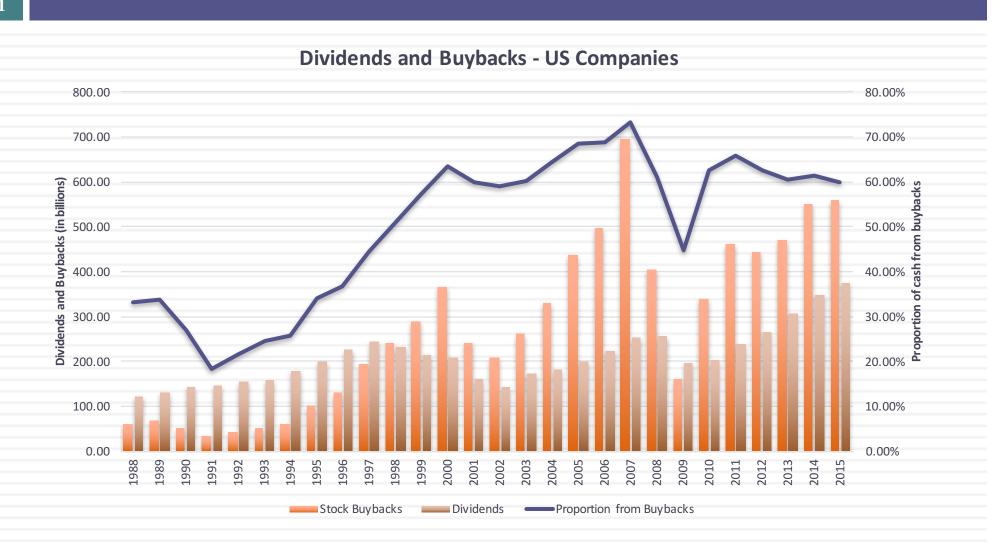

In 2003

In the last quarter of 2012

- As the possibility of tax rates reverting back to pre-2003 levels rose, 233 companies paid out \$31 billion in dividends.
- Of these companies, 101
 had insider holdings in
 excess of 20% of the
 outstanding stock.

IV. More and more US firms are buying back stock, rather than pay dividends...

And its going global..

The 2015 Numbers

Region	Dividends	Buybacks	Cash Returned	Dividend Yield	Cash Return Yield	Buybacks as % of Cash Returned
Africa and Middle East	\$ 67,368	\$ 2,680	\$ 70,048	3.87%	4.03%	3.83%
Australia & NZ	\$ 53,687	\$ 6,452	\$ 60,139	4.46%	4.99%	10.73%
Canada	\$ 45,432	\$ 24,452	\$ 69,884	3.01%	4.63%	34.99%
China	\$ 221,565	\$ 4,693	\$ 226,258	2.40%	2.45%	2.07%
