ΤY	\$41,346	\$2,340	NA			Assumed to	be =	20.00%

Lesson 5: The dilution is taken care off..

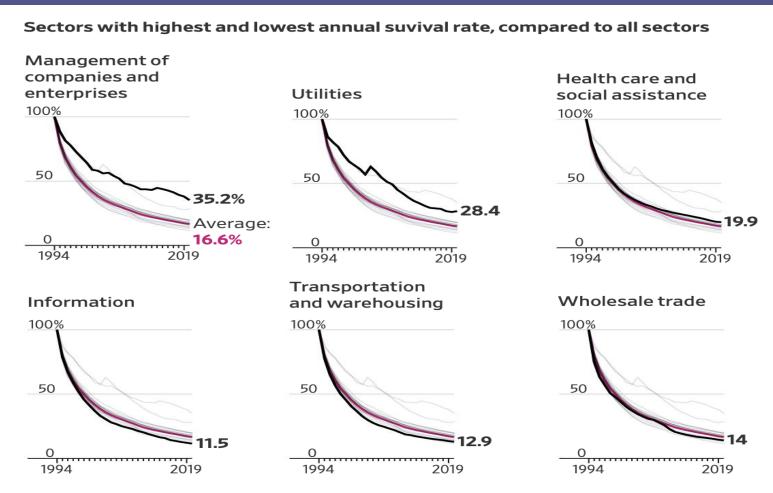

- With young growth companies, it is almost a given that the number of shares outstanding will increase over time for two reasons:
 - To grow, the company will have to issue new shares either to raise cash to take projects or to offer to target company stockholders in acquisitions
 - Many young, growth companies also offer options to managers as compensation and these options will get exercised, if the company is successful.
- In DCF valuation, both effects are already incorporated into the value per share, even though we use the current number of shares in estimating value per share
 - The need for new equity issues is captured in negative cash flows in the earlier years. The present value of these negative cash flows will drag down the current value of equity and this is the effect of future dilution.
 - The options are valued and netted out against the current value. Using an option pricing model allows you to incorporate the expected likelihood that they will be exercised and the price at which they will be exercised.

Lesson 6: If you are worried about failure, incorporate into value

A 2019 Update: Sector Comparison

297

Source: Bureau of Labor Statistics, Business Employment Dynamics data

Lesson 7: There are always scenarios where the market price can be justified...

	6%	8%	10%	12%	14%		
30%	\$ (1.94)	\$ 2.95	\$ 7.84	\$ 12.71	\$	17.57	
35%	\$ 1.41	\$ 8.37	\$ 15.33	\$ 22.27	\$	29.21	
40%	\$ 6.10	\$ 15.93	\$ 25.74	\$ 35.54	\$	45.34	
45%	\$ 12.59	\$ 26.34	\$ 40.05	\$ 53.77	\$	67.48	
50%	\$ 21.47	\$ 40.50	\$ 59.52	\$ 78.53	\$	97.54	
55%	\$ 33.47	\$ 59.60	\$ 85.72	\$ 111.84	\$	137.95	
60%	\$ 49.53	\$ 85.10	\$ 120.66	\$ 156.22	\$	191.77	

Lesson 8: You will be wrong 100% of the tim and it really is not your fault...

- No matter how careful you are in getting your inputs and how well structured your model is, your estimate of value will change both as new information comes out about the company, the business and the economy.
- As information comes out, you will have to adjust and adapt your model to reflect the information. Rather than be defensive about the resulting changes in value, recognize that this is the essence of risk.
- <u>A test</u>: If your valuations are unbiased, you should find yourself increasing estimated values as often as you are decreasing values. In other words, there should be equal doses of good and bad news affecting valuations (at least over time).

And the market is often "more wrong"....

Amazon

The Greatest (and most Feared) Disruptive Platform in History

Amazon will complete its metaphorsis from being a retail company to one that can take its competitive advantages - access to capital & willingness to lose money for long periods, while disrupting and changing the status quo - to any business that it targets, giving it the potential for high revenue growth on top of already-large revenues. It will be able to use the pricing power it accumulates in each business it is in, to increase profit margins, partly through economies of scale and partly through higher prices. Its low debt ratio and divergent business mix give it a low cost of capital.

II. Mature Companies in transition..

- Mature companies are generally the easiest group to value. They have long, established histories that can be mined for inputs. They have investment policies that are set and capital structures that are stable, thus making valuation more grounded in past data.
- However, this stability in the numbers can mask real problems at the company. The company may be set in a process, where it invests more or less than it should and does not have the right financing mix. In effect, the policies are consistent, stable and bad.
 - If you expect these companies to change or as is more often the case to have change thrust upon them,

The perils of valuing mature companies...

Figure 7.1: Estimation Issues - Mature Companies

Hormel Foods: The Value of Control Changing

Hormel Foods sells packaged meat and other food products and has been in existence as a publicly traded company for almost 80 years. In 2008, the firm reported after-tax operating income of \$315 million, reflecting a compounded growth of 5% over the previous 5 years. *The Status Quo*

Run by existing management, with conservative reinvestment policies (reinvestment rate = 14.34% and debt ratio = 10.4%.

Anemic growth rate and short growth period, due to reinvestment policy

Low debt ratio affects cost of capital

∖₋

		A					>	
Year	Operating income after taxes	Expected growth rate	ROC	Reinvestment Rate	Reinvestment	FCFF	Cost of capital	Present Value

Lesson 1: Cost cutting and increased efficiency are easier accomplished on paper than in practice... and require commitment

307

Lesson 2: Increasing growth is not always a value creating option.. And it may destroy value at times..

308

Lesson 3: Financial leverage is a double-edged sword..

309

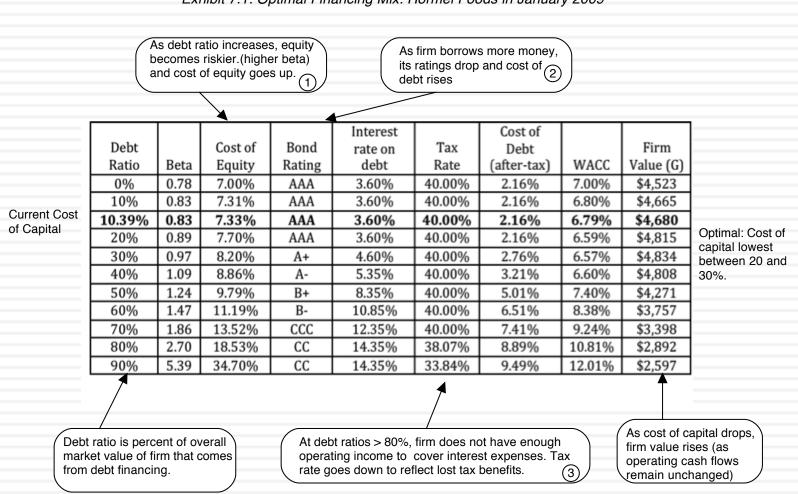

Exhibit 7.1: Optimal Financing Mix: Hormel Foods in January 2009

III. Dealing with decline and distress...

310

Historial data often reflects flat or declining revenues and falling margins. Investments often earn less than the cost of capital.

Growth can be negative, as firm sheds assets and shrinks. As less profitable assets are shed, the firm's remaining assets may improve in quality.

What is the value added by growth assets?

What are the cashflows from existing assets?

Underfunded pension obligations and litigation claims can lower value of equity. Liquidation preferences can affect value of equity

What is the value of equity in the firm?

How risky are the cash flows from both existing assets and growth assets?

Depending upon the risk of the assets being divested and the use of the proceeds from the divestuture (to pay dividends or retire debt), the risk in both the firm and its equity can change. When will the firm become a mature fiirm, and what are the potential roadblocks?

There is a real chance, especially with high financial leverage, that the firm will not make it. If it is expected to survive as a going concern, it will be as a much smaller entity.

a. Dealing with Decline

- In decline, firms often see declining revenues and lower margins, translating in negative expected growth over time.
- If these firms are run by good managers, they will not fight decline. Instead, they will adapt to it and shut down or sell investments that do not generate the cost of capital. This can translate into negative net capital expenditures (depreciation exceeds cap ex), declining working capital and an overall negative reinvestment rate. The best case scenario is that the firm can shed its bad assets, make itself a much smaller and healthier firm and then settle into long-term stable growth.
- As an investor, your worst case scenario is that these firms are run by managers in denial who continue to expand the firm by making bad investments (that generate lower returns than the cost of capital). These firms may be able to grow revenues and operating income but will destroy value along the way.

	Declining business: Revenues expected to drop by 3% a year fo next 5 years															Margins improve gradually to

bring in 50% of book value																							

Figure 14.5: A Valuation of JC Penney

Г

b. Dealing with the "downside" of Distress

- A DCF valuation values a firm as a going concern. If there is a significant likelihood of the firm failing before it reaches stable growth and if the assets will then be sold for a value less than the present value of the expected cashflows (a distress sale value), DCF valuations will overstate the value of the firm.
- Value of Equity= DCF value of equity (1 Probability of distress) + Distress sale value of equity (Probability of distress)
- □ There are three ways in which we can estimate the probability of distress:
 - Use the bond rating to estimate the cumulative probability of distress over 10 years
 - Estimate the probability of distress with a probit
 - Estimate the probability of distress by looking at market value of bonds..
- The distress sale value of equity is usually best estimated as a percent of book value (and this value will be lower if the economy is doing badly and there are other firms in the same business also in distress).

Adjusting the value of LVS for distress..

315

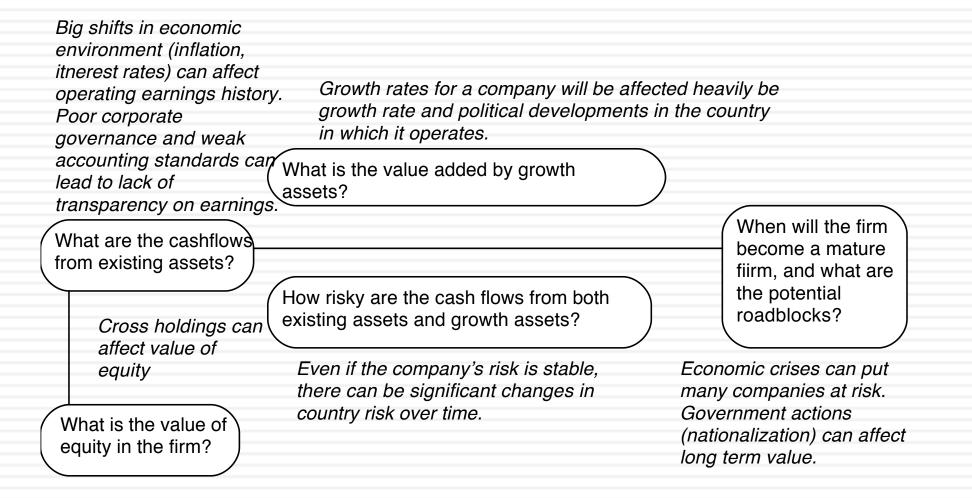

In February 2009, LVS was rated B+ by S&P. Historically, 28.25% of B+ rated bonds default within 10 years. LVS has a 6.375% bond, maturing in February 2015 (7 years), trading at \$529. If we discount the expected cash flows on the bond at the riskfree rate, we can back out the probability of distress from the bond price:

$$529 = \sum_{t=1}^{t=7} \frac{63.75(1 - \Pi_{\text{Distress}})^{t}}{(1.03)^{t}} + \frac{1000(1 - \Pi_{\text{Distress}})^{7}}{(1.03)^{7}}$$

- Solving for the probability of bankruptcy, we get:
 - \Box $\pi_{istress}$ = Annual probability of default = 13.54%
 - **c** Cumulative probability of surviving 10 years = $(1 .1354)^{10} = 23.34\%$
 - Cumulative probability of distress over 10 years = 1 .2334 = .7666 or 76.66%
- If LVS is becomes distressed:
 - Expected distress sale proceeds = \$2,769 million < Face value of debt</p>
 - Expected equity value/share = \$0.00
- □ Expected value per share = \$8.12 (1 .7666) + \$0.00 (.7666) = \$1.92

IV. Emerging Market Companies

Estimation Issues - Emerging Market Companies

Lesson 1: Country risk has to be incorporated... but with a scalpel, not a bludgeon

- 317
- Emerging market companies are undoubtedly exposed to additional country risk because they are incorporated in countries that are more exposed to political and economic risk.
- Not all emerging market companies are equally exposed to country risk and many developed markets have emerging market risk exposure because of their operations.
- You can use either the "weighted country risk premium", with the weights reflecting the countries you get your revenues from or the lambda approach (which may incorporate more than revenues) to capture country risk exposure.
