4. Relevance
5. Policy
6. Conclusion

- What is Minimum Resale Price Maintenance? (RPM)

Research question

- Research Question:

1. “Can RPM be an exclusionary mechanism?”
2. “How might this work?”
3. “When might we look for it?”

- Approach:

Objective is to build a theoretical structure to inform observation

- Why is this interesting?

1. US Supreme Court:

- *Dr Miles* 1911 – per se violation of §1
- *Leegin* 2007 – overturns *Dr Miles*, now rule of reason

2. European Vertical Restraint Guidelines released 2010

3. A lot of work on pro-competitive theories in 80s/90s, some work on facilitation of collusion.

4. Need for better developed theories of harm.

1. **Introduction**

2. Framework

3. Analysis

4. Relevance

5. Policy

6. Conclusion

Basic story

- Basic story to come out of the analysis here:

Minimum resale price maintenance can be a way to force retailers to internalize the effects of upstream entry on industry profits. If retailers let an entrant in, the profits in which they share (via RPM) get dissipated away.

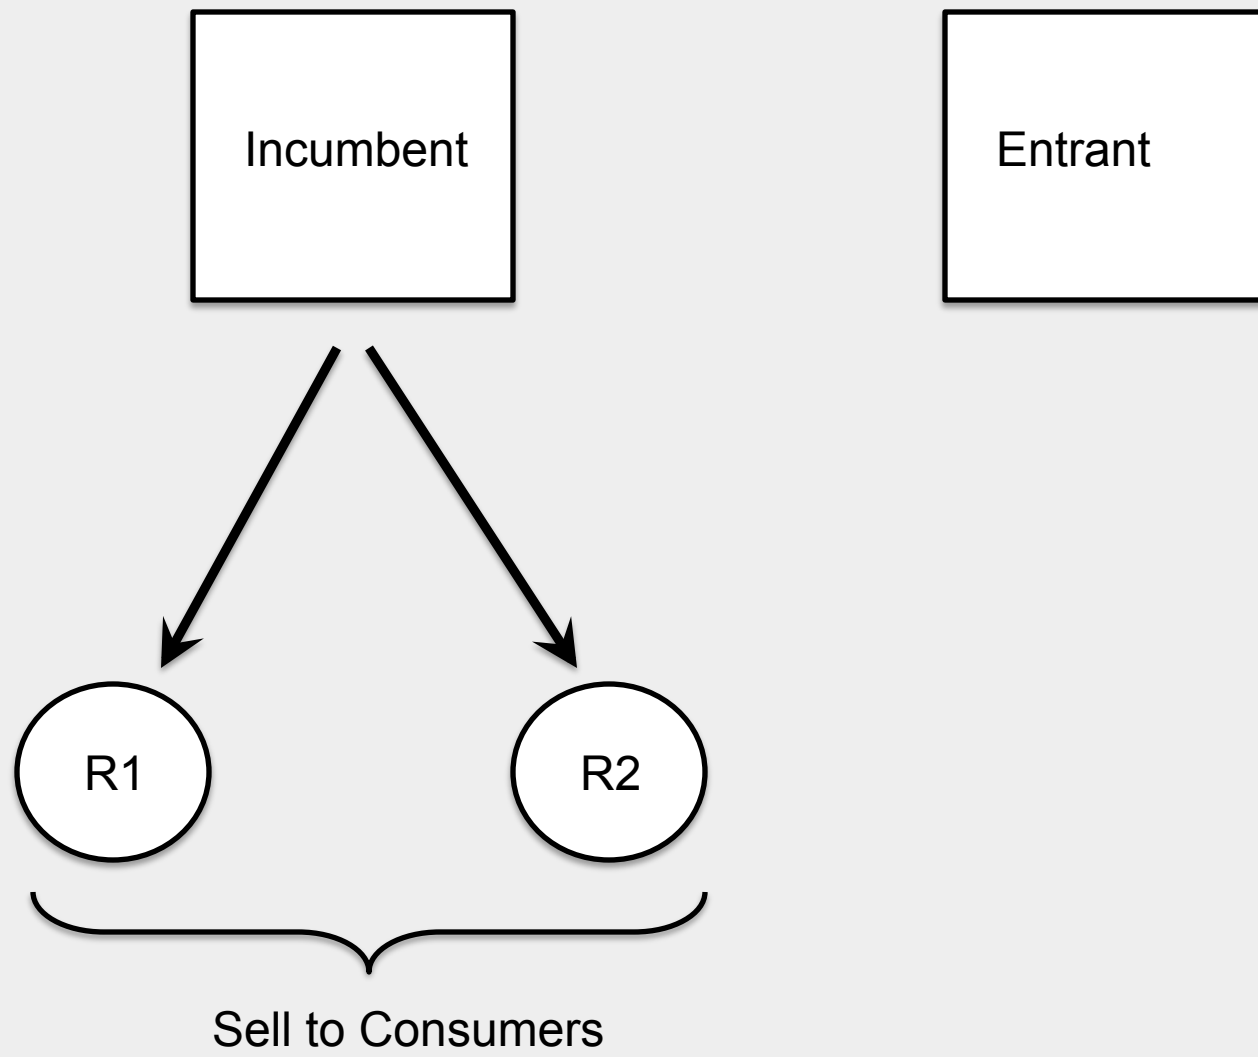

Gives foundations for:

Kennedy, J. in *Leegin* 2007: “A manufacturer with market power, by comparison, might use resale price maintenance to give retailers an incentive not to sell the products of smaller rivals or new entrants.”

5. Policy
6. Conclusion

Geneology

- This is not a new idea but is somewhat forgotten
 - Yamey 1966: *“Resale Price Maintenance can serve the purposes of a group of manufacturers acting together in restraint of competition by being part of a bargain with associations of established dealers to induce the latter not to handle the competing products of excluded manufacturers.”*
 - Kennedy, J. in Leegin 2007: *“A manufacturer with market power, by comparison, might use resale price maintenance to give retailers an incentive not to sell the products of smaller rivals or new entrants.”*
- Pro-competitive theories: Telser 60, Posner 75, Matthewson and Winter 84, Klein and Murphy 88, Deneckere, Marvel and Peck 96,97, Winter 09
- Collusive theories: Shaffer 91, O’Brien and Shaffer 92, Julien and Rey 07, Rey and Verge 09

1. Introduction
2. Framework
3. **Analysis**
4. Relevance
5. Policy
6. Conclusion

Comments

An exclusionary equilibrium exists if and only if

Conditions for Exclusionary Equilibrium

$$\text{NPV of profits shared with retailer via RPM} \geq \text{Entrant's profit from undercutting} + \text{NPV of post-entry competition} - F_e$$

Robustness:

- Still get exclusion if there is product differentiation
 - Product differentiation may make exclusion easier in some cases
- Different forms of post-entry competition can still lead to exclusion
- Demand conditions influence the extent, but not possibility, of exclusion
- Can get exclusion if fixed cost is zero, more on this later.

Exclusion in Whisky

1. Introduction
2. Framework
3. Analysis
4. **Relevance**
5. Policy
6. Conclusion

- The Distilling and Cattle Feeding Company [*US v. Greenhut*, 1892 U.S. Dist. Ct]
 - Company: *“purchased or leased or otherwise obtained control of 70 distilleries, which had theretofore been competing, separate distilleries, and so operated them as to produce 77,000,000 gallons of distillery product, which output comprised about 75-100 of the total production of the distilleries of the United States”*
 - 1890 entered into distribution contract: *“the defendants, six months after date, promised to repay to Kelly & Durkee five cents per proof gallon of defendants' products then purchased, upon condition that said purchasers ..., from date of voucher or purchase to time of payment, shall buy exclusively such kind of goods as are produced by defendants from some one of their agents designated, and shall not sell the same at prices lower than said dealers' list prices”*
- Note: use of explicit rebates, explicit conditioning on exclusivity, and explicit timeframe

Exclusionary Minimum
Resale Price
Maintenance

Empirical Relevance

Exclusion in Sugar

1. Introduction
2. Framework
3. Analysis
- 4. Relevance**
5. Policy
6. Conclusion

- The American Sugar Company
 - Trust formed in 1887 combining sugar refining operations controlling 80 per cent of industry capacity
 - Rising to 95 per cent of capacity by 1982
 - In 1895 wholesale grocers association proposes RPM
 - Zerbe reports proposal came in the form of “a threat and a bribe”
 - Arbuckle enters in 1898, although has to create own distribution in some areas, and excluded in others
 - Mix of raising rivals costs and exclusion

(American and Arbuckle form a cartel soon after that lasts till WWI)

(Zerbe (1969), Eichner (1969), Marvel and McAfferty (1985))

Demand: $q = 10 - p$

Incumbent's MC = 4,

Vertical axis is $(4 - \text{MC of excluded})$

Law, policy and screens

Leegin

“The source of the restraint may also be an important consideration.

*If there is evidence retailers were the impetus [*898] for a vertical price restraint, there is a greater likelihood that the restraint facilitates a retailer cartel or supports a dominant, inefficient retailer. See Brief for William S. Comanor et al. as Amici Curiae 7-8.*

If, by contrast, a manufacturer adopted the policy independent of retailer pressure, the restraint is less likely to promote anticompetitive conduct...(Leegin at 897-898)

It makes all the difference whether minimum retail prices are imposed by the manufactures in order to evoke point-of-sale services or by the dealers in order to obtain monopoly profits. (Leegin at 898 citing Posner, 2001, at 177)”

1. Introduction
2. Framework
3. Analysis
4. Relevance
5. **Policy**
6. Conclusion

In our framework, exclusion works to advantage of both retailers and incumbent. Further, anecdotal evidence suggests may be initiated by either.

Exclusionary Minimum
Resale Price
Maintenance

Law, policy and
screens

European
Guidelines on
Vertical
Restraints

[226] The possible competition risk of maximum and recommended prices is firstly that the maximum or recommended price will work as a focal point for the resellers and might be followed by most or all of them. A second competition risk is that maximum or recommended prices may facilitate collusion between suppliers.

No mention of exclusion, RPM on matters on the “intensive” margin (pricing) and no consideration of “extensive” margin (entry).

1. Introduction
2. Framework
3. Analysis
4. Relevance
- 5. Policy**
6. Conclusion

Conclusion

- Framework by which RPM can be argued to be exclusionary
- Empirically relevant issue
- Framework indicates economically significant harm is possible
- Current law and policy more focused in collusion on the intensive margin (prices) rather than effect on the extensive margin (exclusion)
 - probably economists are at fault for this

Take Away:

Minimum resale price maintenance can be a way to force retailers to internalize the effects of upstream entry on industry profits. If retailers let an entrant in, the profits in which they share (via RPM) get dissipated away. This provides an incentive to not accommodate entrants.

3. **Model**
4. Analysis
5. Extensions
6. Policy

Baseline Model

- Structure of play:
- Infinite horizon, δ is the common, per-period discount rate, ($\delta > 1/2$)
- Each period, incumbent offers (p_i, w_i) retail and wholesale price
 - Define RPM as occurring when this leads to a price different from what unrestricted competition between retailers would generate.
 - Cannot differ across retailers or units
 - No commitment outside of period
- Entrant competes similarly if established in the market
- Entrant, before retail presence established can offer a lump sum payment R to retailer
 - This assumption makes exclusion hardest

Three Extensions:

- Relax the MPNE assumption:
 - Why can't the entrant exclude the incumbent after entry? Wouldn't retailers agree to this?
 - Allow for collusion among: i) manufacturers; and ii) retailers
- Extend the baseline model to accommodate differentiation

1. Introduction
2. Context
3. Model
4. Analysis
- 5. Extensions**
6. Policy

Extensions:

Why can't the entrant exclude the incumbent after entry? Wouldn't retailers agree to this?

The post-entry price of entrant is found by solving

$$\tilde{p}_e^* = \arg \max_{(\tilde{p}_e, \tilde{w}_e)} (\tilde{w}_e - c_e) q(\tilde{p}_e)$$

subject to

$$\text{IC: } \frac{1}{1-\delta} \frac{1}{n} (\tilde{p}_e - \tilde{w}_e) q(\tilde{p}_e) \geq (\tilde{p}_e - c_i) q(\tilde{p}_e)$$

$$\text{IR: } \frac{1}{1-\delta} \frac{1}{n} (\tilde{p}_e - \tilde{w}_e) q(\tilde{p}_e) - (\tilde{p}_e - c_i) q(\tilde{p}_e) > \frac{1}{1-\delta} (c_i - c_e) q(c_i)$$

Which simplifies to

$$\tilde{p}_e^* = \arg \max_{\tilde{p}_e \geq c_i} (\tilde{p}_e - c_e) q(\tilde{p}_e) - (1-\delta) n (\tilde{p}_e - c_i) q(\tilde{p}_e)$$

Extensions:

Why can't the
entrant exclude the
incumbent after
entry?

Proposition 1A Suppose that $\frac{1}{1-\delta} \frac{1}{n} > 1$. Then, an exclusionary equilibrium (one in which the entrant does not enter) exists if and only if

$$F_e + \frac{1}{1-\delta} \frac{1}{n} (p_i^m - c_i) q(p_i^m) \geq (p_e^m - c_e) q(p_e^m) + \frac{\delta}{1-\delta} \left[(\tilde{p}_e^* - c_e) q(\tilde{p}_e^*) - (1-\delta) n (\tilde{p}_e^* - c_i) q(\tilde{p}_e^*) \right]. \quad (5)$$

Table 1A: Exclusion by the Incumbent and Entrant

$q = 10 - 0.5p, c_i = 5$				Does Entrant Exclude Incumbent?	Does Incumbent Exclude Entrant?	Range of F_e excluded (if any)
δ	n	c_e	Max F_e			
0.95	19	4	150	No	Yes	[144.9, 150]
0.95	18	4	150	Yes	Yes	[149.2, 150]
0.95	17	4	150	Yes	No	—
0.70	3	4	25	Yes	Yes	[19.0, 25]
0.70	2	4	25	Yes	No	—
0.95	19	4.5	75	Yes	Yes	[74.6, 75]
0.95	18	4.5	75	Yes	No	—
0.95	19	3.5	225	No	No	—
0.95	18	3.5	225	No	Yes	[216.5, 225]
0.95	17	3.5	225	Yes	Yes	[223.6, 225]
0.95	16	3.5	225	Yes	No	—

Note: $\max\{F_e\} = \frac{1}{1-\delta} (c_i - c_e) q(c_i)$, i.e. the largest fixed cost consistent with entry without exclusion

Caution in suggested screens?

- Manufacture vs retailer initiated

- *It makes all the difference whether minimum retail prices are imposed by the manufactures in order to evoke point-of-sale services or by the dealers in order to obtain monopoly profits. (Leegin citing Posner, 2001)*

- Competition

- If measure competition using x-elasticities then we stress caution in saying competition is good.
 - HHI's, or C4 etc might actually be more useful.

- Ease of vertical integration

- Implicitly assume away vertical integration, but might be a useful screen in assessing strength of entry barrier.

- Bound gives a quick litmus test of empirical relevance.

3. Model
4. Analysis
5. Extensions
6. **Policy**

Conclusion

Minimum resale price maintenance can be a way to force retailers to internalize the effects of upstream entry on industry profits. If retailers let an entrant in, the profits in which they share (via RPM) get dissipated away.
